

NOAA Sea Level Rise and Coastal Flood Predictions

US CLIVAR Multi-Year Workshop
March 28, 2022

William Sweet
NOAA Oceanographer

Coastal Flooding and Sea Level Rise

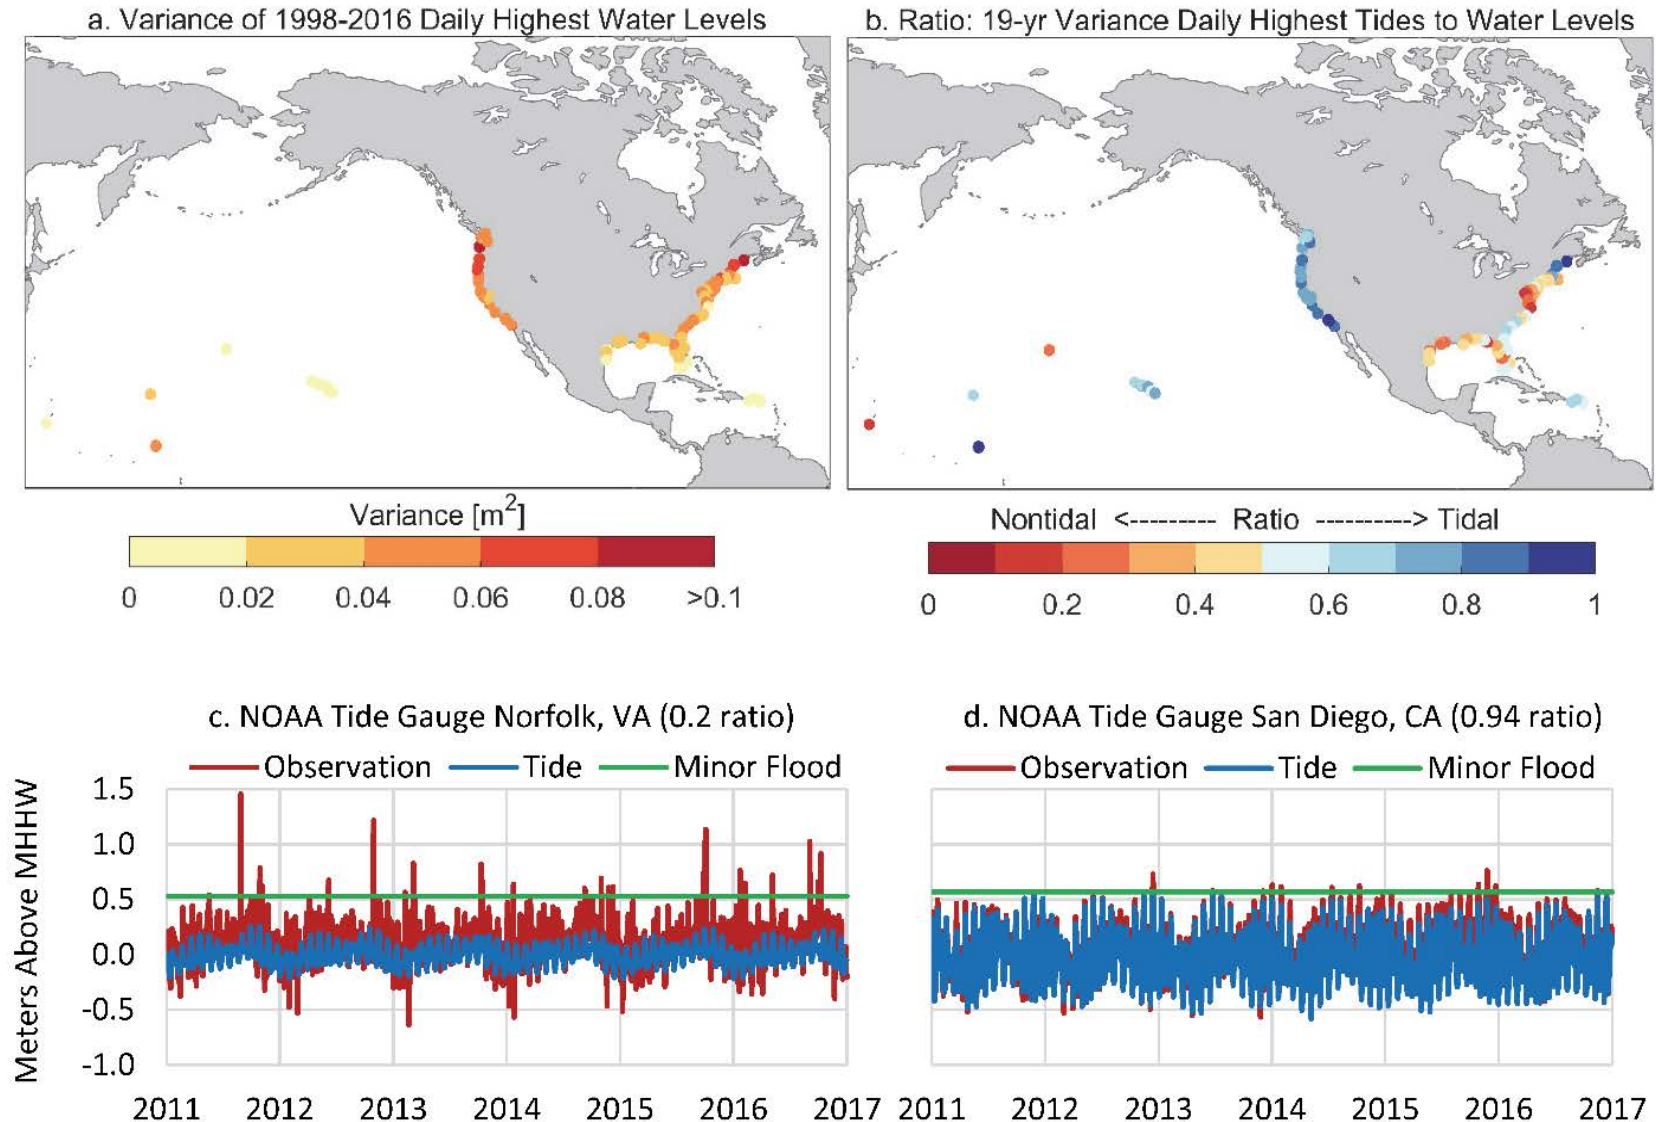

Problem: Coastal Communities are flooding more often due to decades of sea level rise.

- When during the year is likely to be the most problematic (for preparedness)?
- How many 'next year' (for smart response budgeting, e.g., people, pumps, other stop-gap measures)?

High Tide Flooding: tides and 'weather'

The tides are key where tide range is large and storm surges are small.

High Tide Bulletin: Winter 2020

When you may experience higher than normal tides between December 2020 and February 2021.

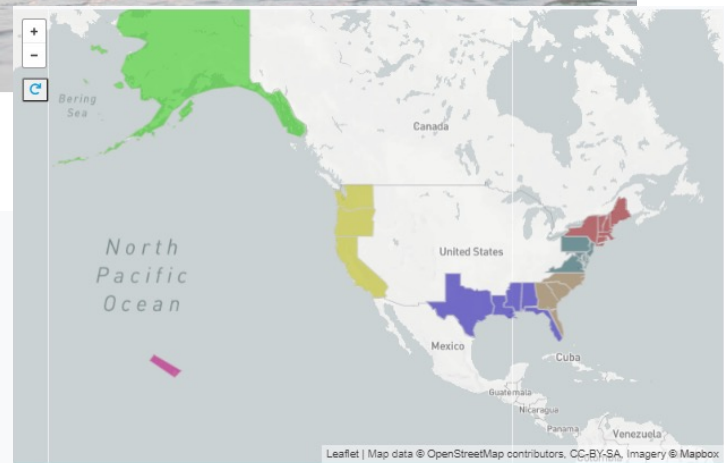

When will the tides be higher than normal?

- December 12 - 17
- January 11 - 13

Why will they be higher than normal?

- A perigean spring tide will be occurring in December. This is when the moon is either new or full and closest to earth. Higher than normal high tides and lower than normal low tides will occur.
- The increased angle of the sun relative to the Earth, which reaches a maximum during the Winter Solstice (December 21).

What kind of impact might I expect along the coast?

NOAA: Annual High Tide Flood Outlook

See below for the high tide flooding trends and outlooks for each tide station monitored by NOAA.

Sewells Point, VA

Year	Flood Days
------	------------

2020	14
------	----

Projected High Tide Flood Days

Year	Flood Days
------	------------

2021	9 - 14
------	--------

2030	20 - 35
------	---------

2050	65 - 170
------	----------

Average No. of flood days in 2000: 5

Record No. of flood days: 15

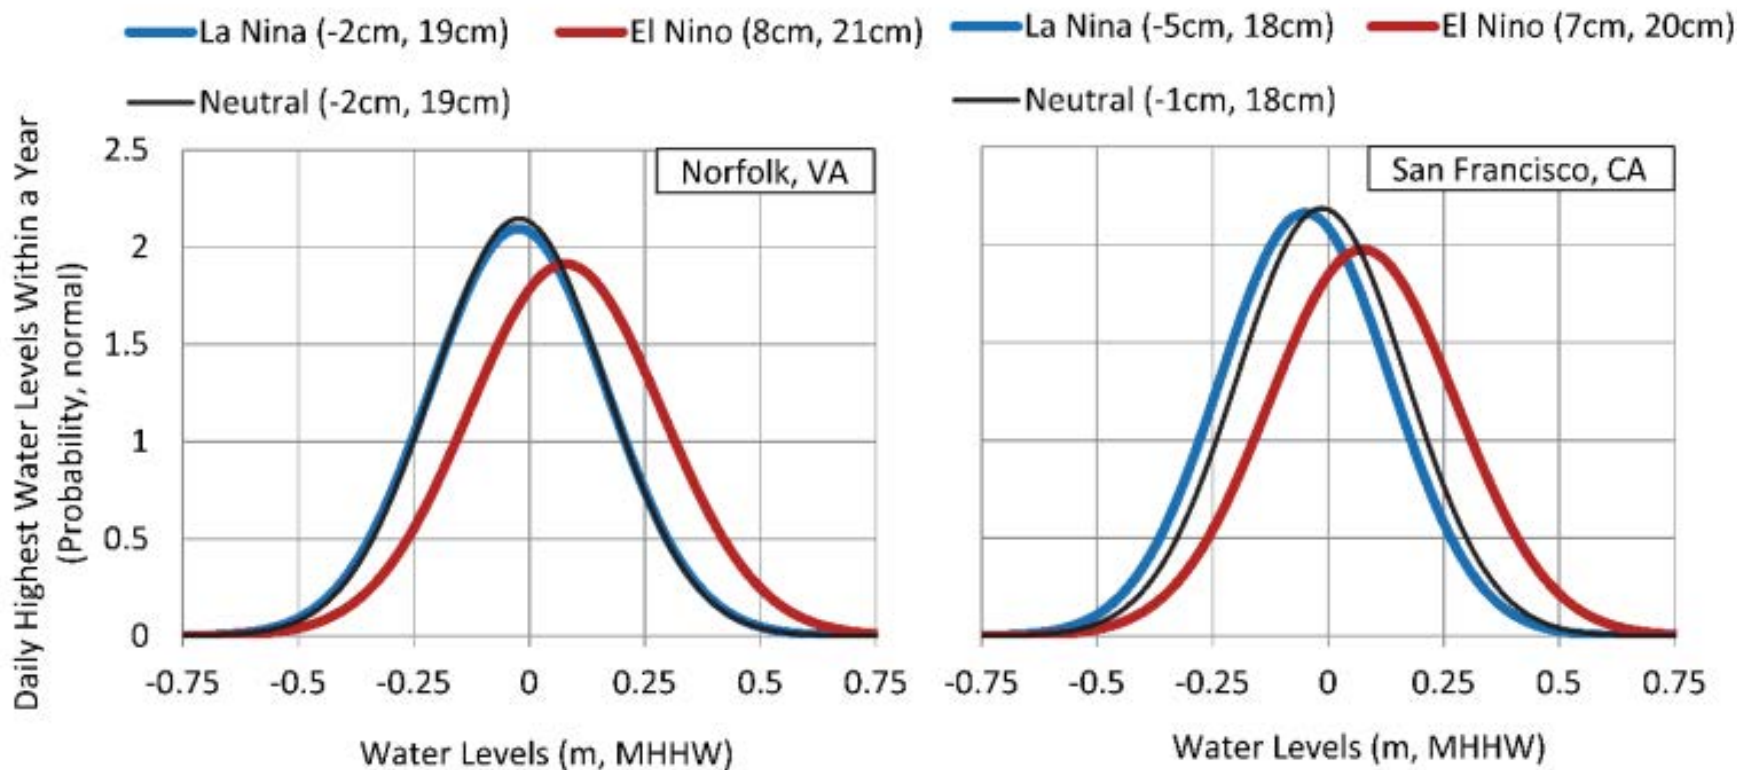

Flood threshold is 0.53m above MHHW

Temporal Trends and ENSO/Climate Patterns in High Tide Flood Frequencies

If not directly simulating with coastal circulation models, then monthly to annual predictions might also be made using time-dependent statistical models with either guidance of 'mean sea level anomaly' or 'climate mode'.

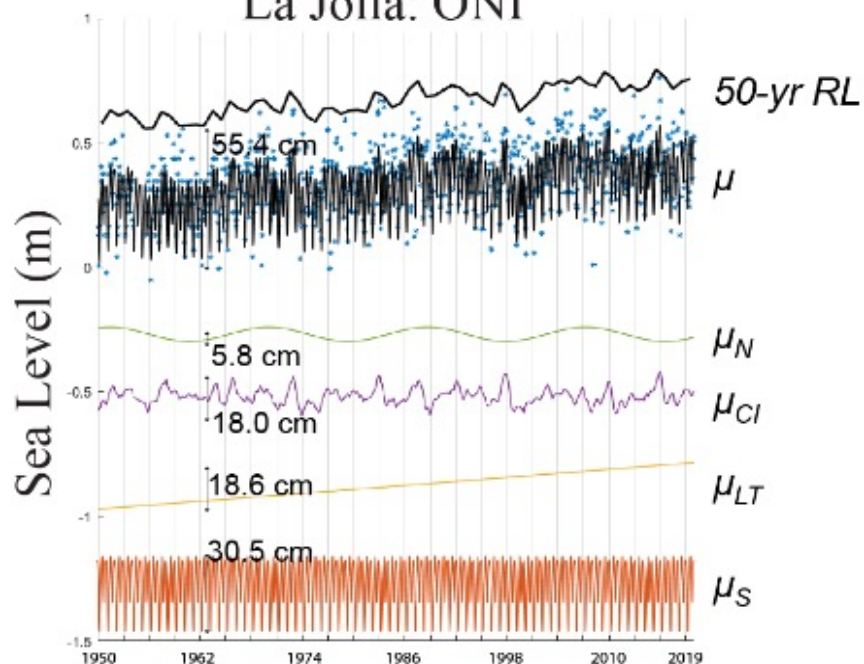

Predictions of High Tide Flood Frequencies V2

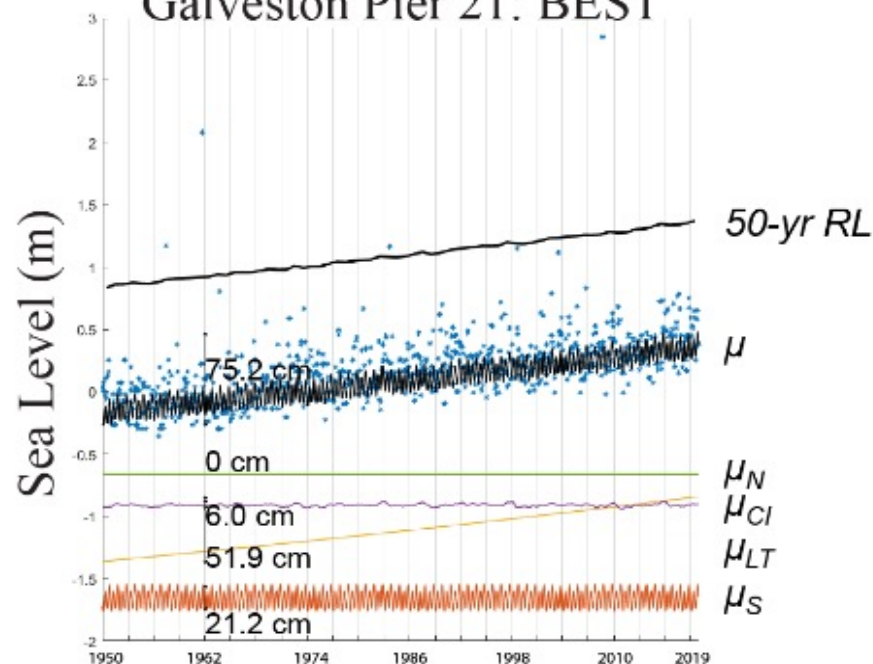

Use of time dependent extreme value statistical models

Exceedance probabilities of minor, moderate and major flood levels that have actionable responses associated with them can be produced with skillful sea level anomaly or climate mode predictions (e.g., 1-24 month).

La Jolla: ONI

Galveston Pier 21: BEST

An aerial photograph of a river delta, likely the Amazon, showing a complex network of water channels and sediment deposits. The image is overlaid with a dark blue, semi-transparent filter. The text is positioned in the upper left quadrant.
