

# Contribution of Land to S2D Predictability Through Atmosphere- Land-Ocean Interactions

July 21, 2025

**L. Ruby Leung**

Pacific Northwest National Laboratory

**US CLIVAR Summit: Earth System Predictability and Use  
of New Tools—AI/ML and High-Resolution Modeling**

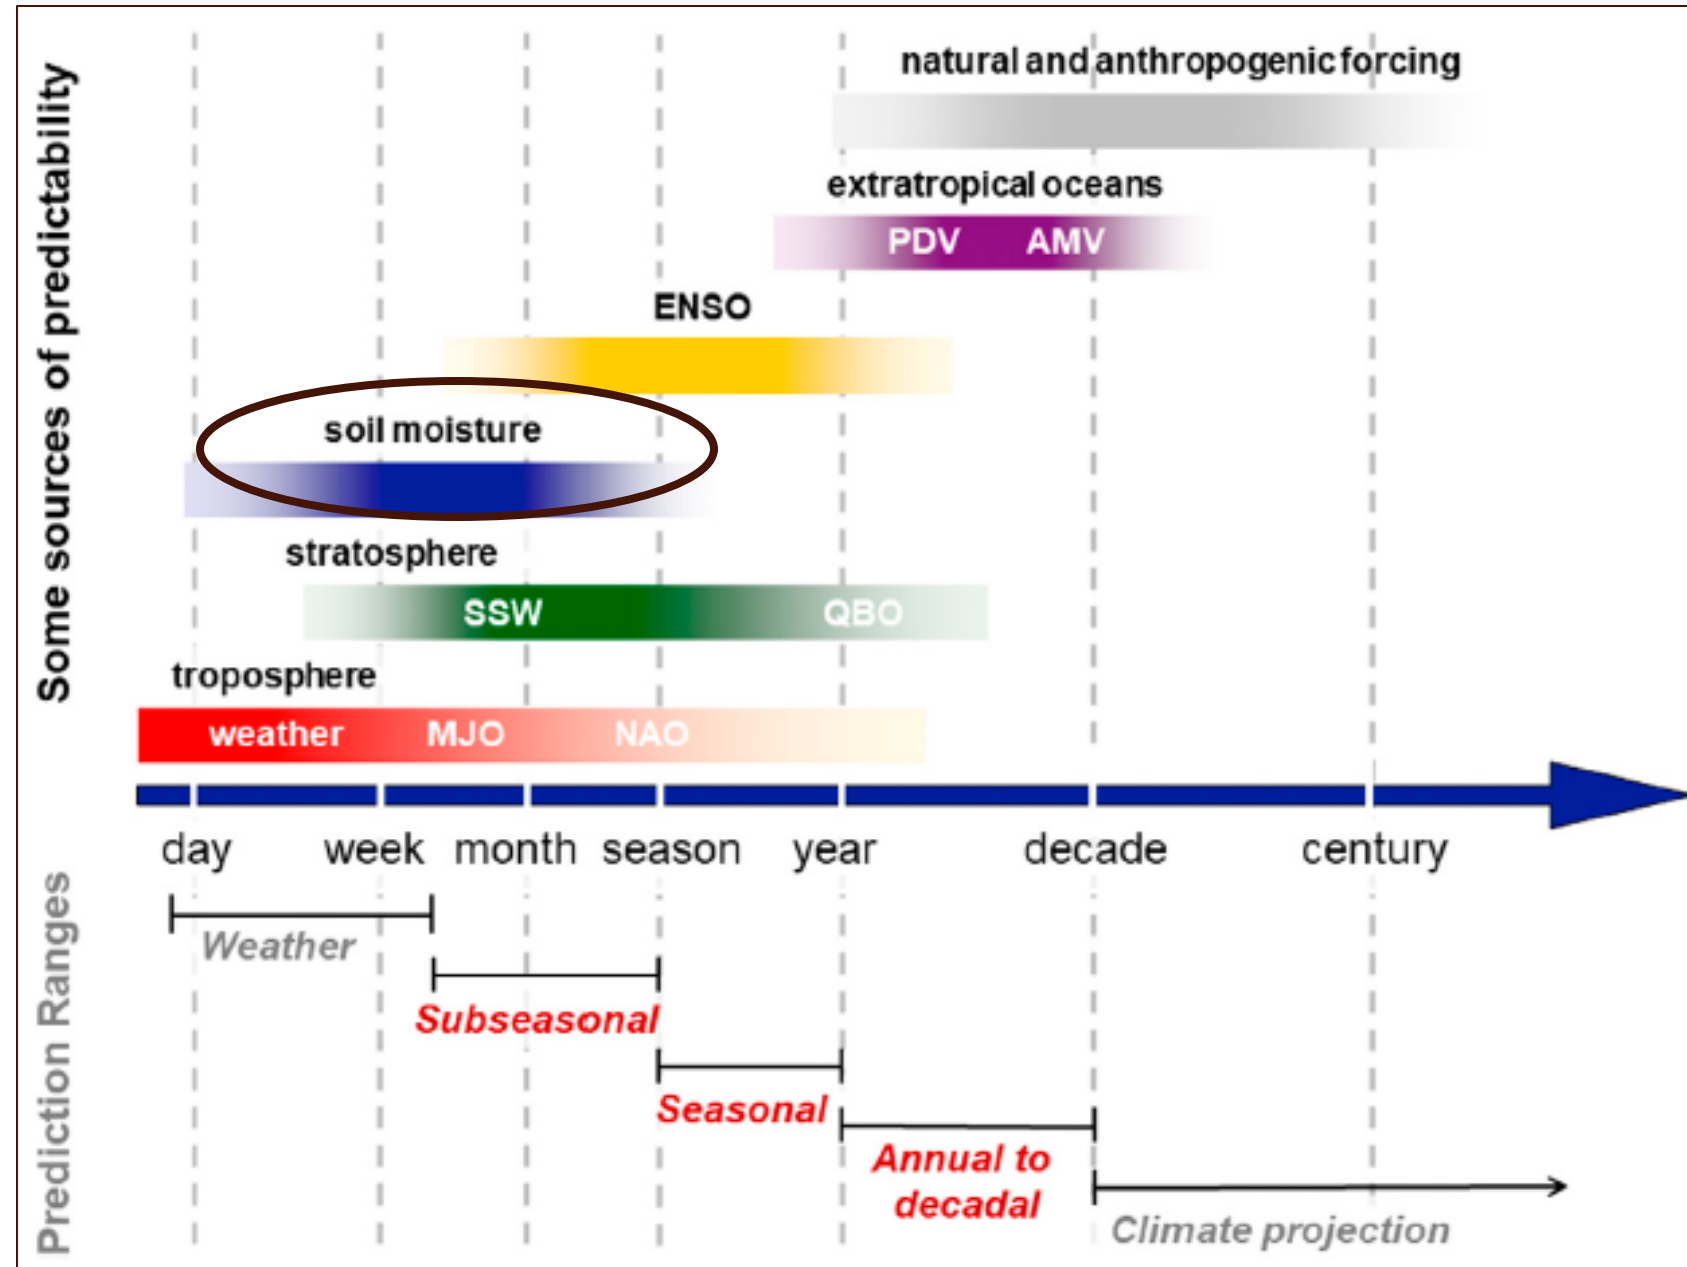

PNNL is operated by Battelle for the U.S. Department of Energy

# Sources of predictability at different timescales

Could soil moisture and temperature provide predictability at seasonal-to-decadal timescales through **longer memory land processes** and/or their **influence on oceans with longer memory**?

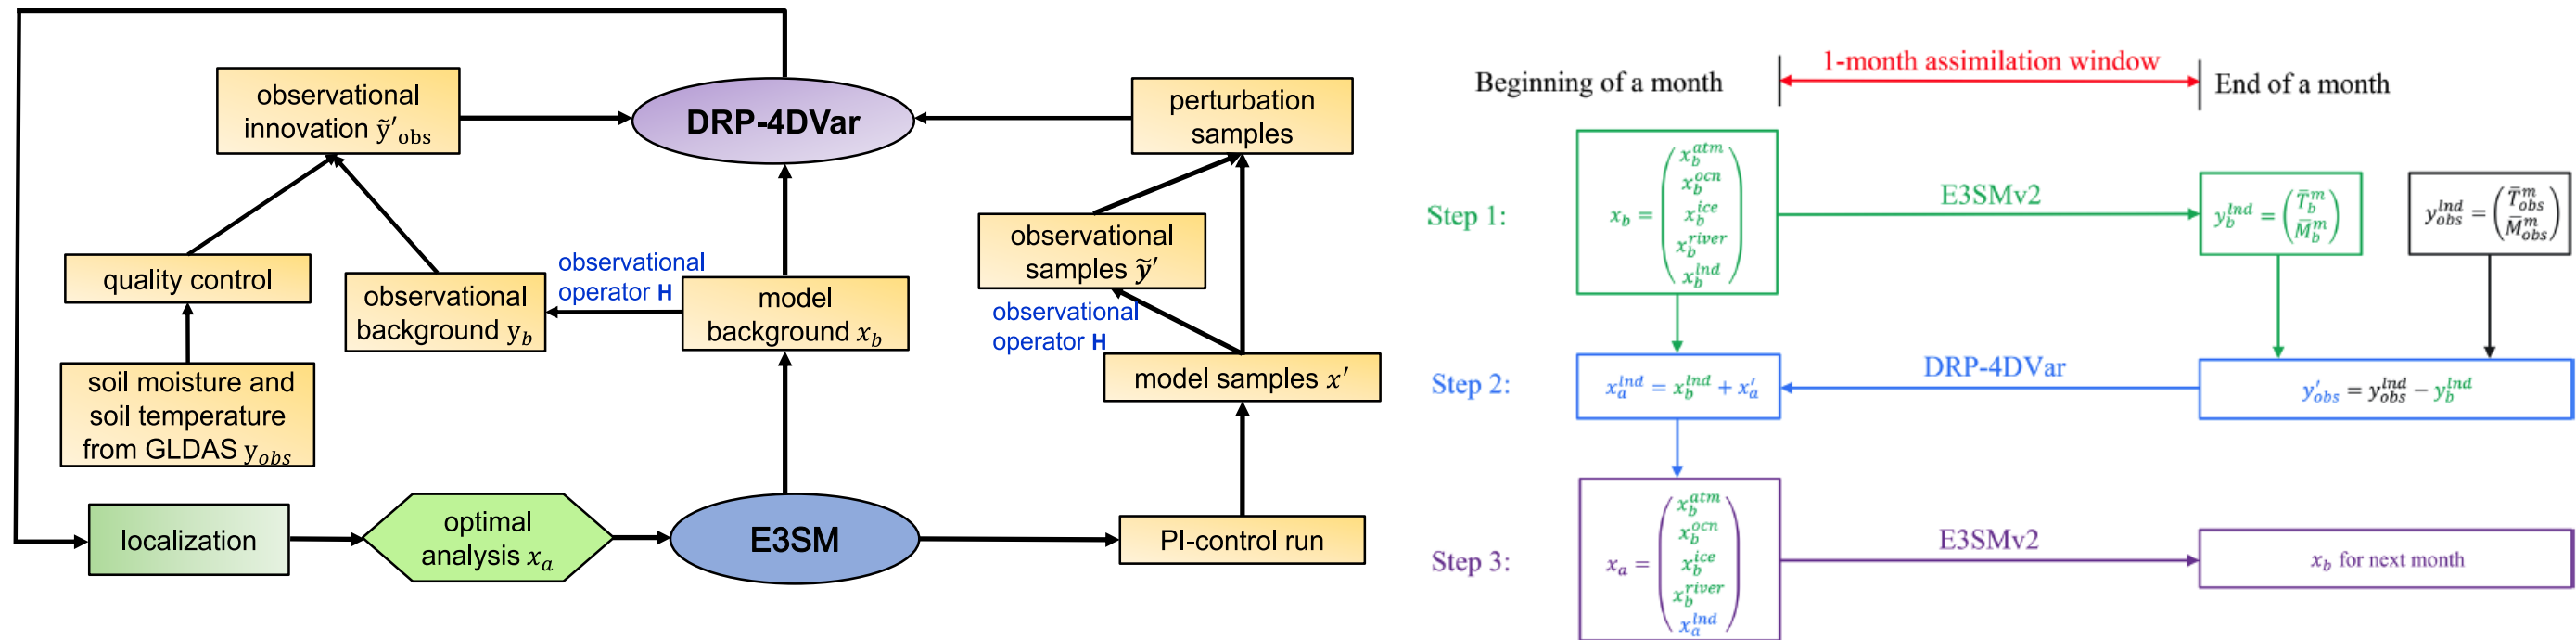

# Land states are not initialized in decadal prediction experiments

CMIP6 decadal climate prediction experiments

Project	Model	Initialization			Reference

# Land as a source of predictability at S2D timescale

A weakly coupled land data assimilation system based on 4DEnVar

(Shi et al. 2021 Earth's Future; Shi et al. 2024 GMD; Shi et al. 2024 npj CAS)

# Experiment design

## ASSIM:

- A fully coupled E3SM simulation with atmosphere, land, ocean, and sea ice
- Monthly mean soil moisture and temperature from GLDAS are continuously assimilated in E3SM with a 1-month assimilation window
- Driven by historical forcing

## HCAST:

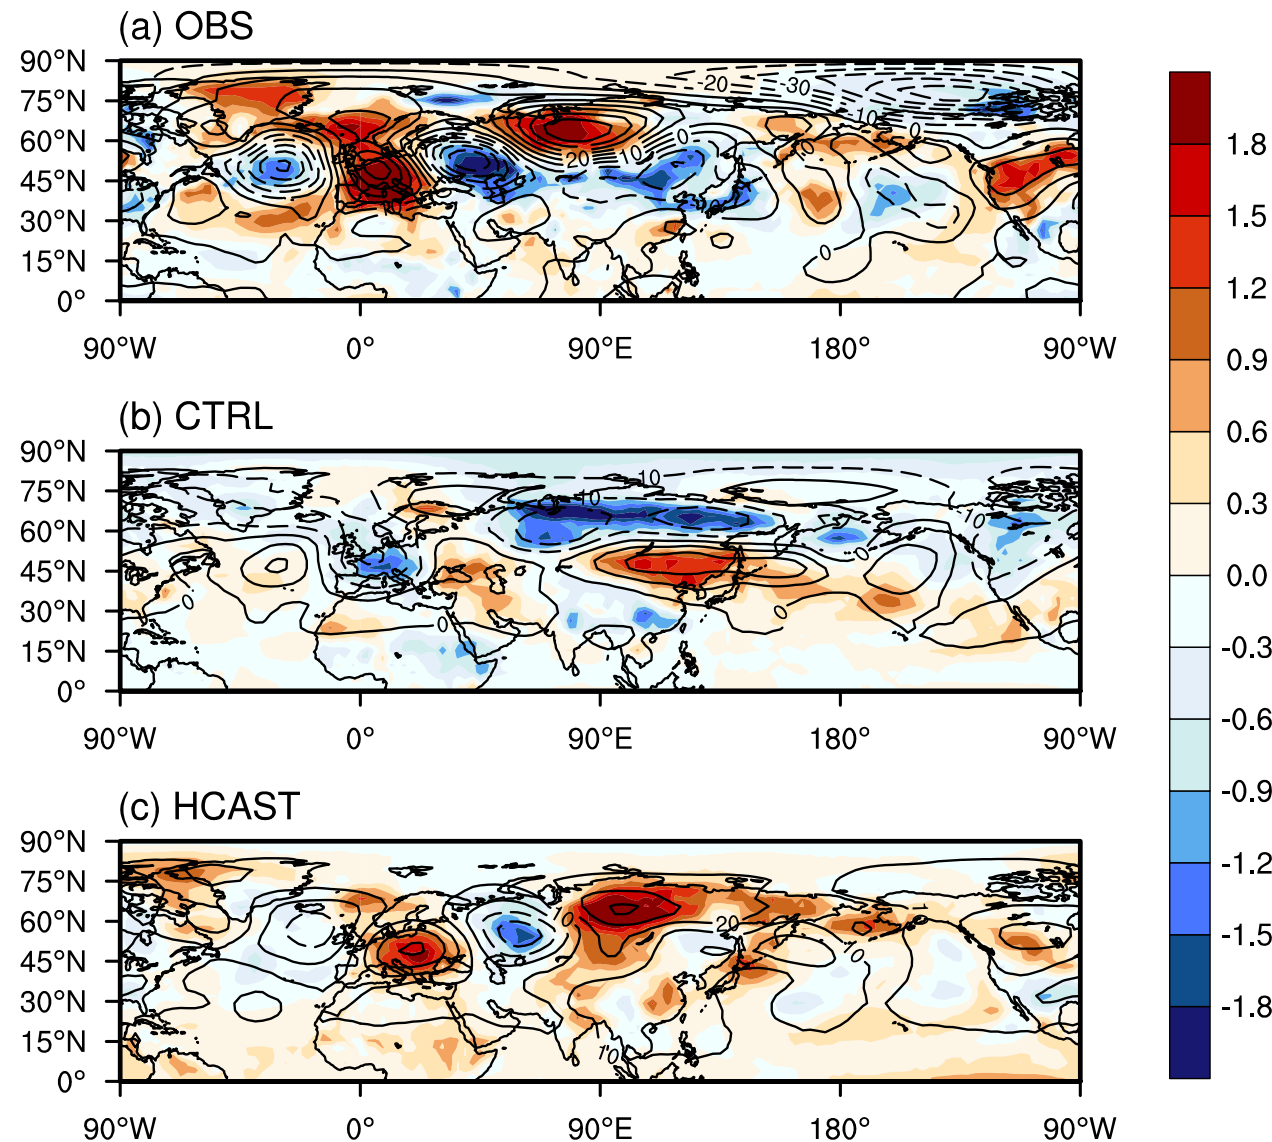

- Fully coupled E3SM ensemble hindcasts (10 members, 5-year long)
- Initialized using restart files from ASSIM with balanced atmosphere, land, and ocean states
- Driven by historical forcing

(Shi et al. 2024 npj CAS)

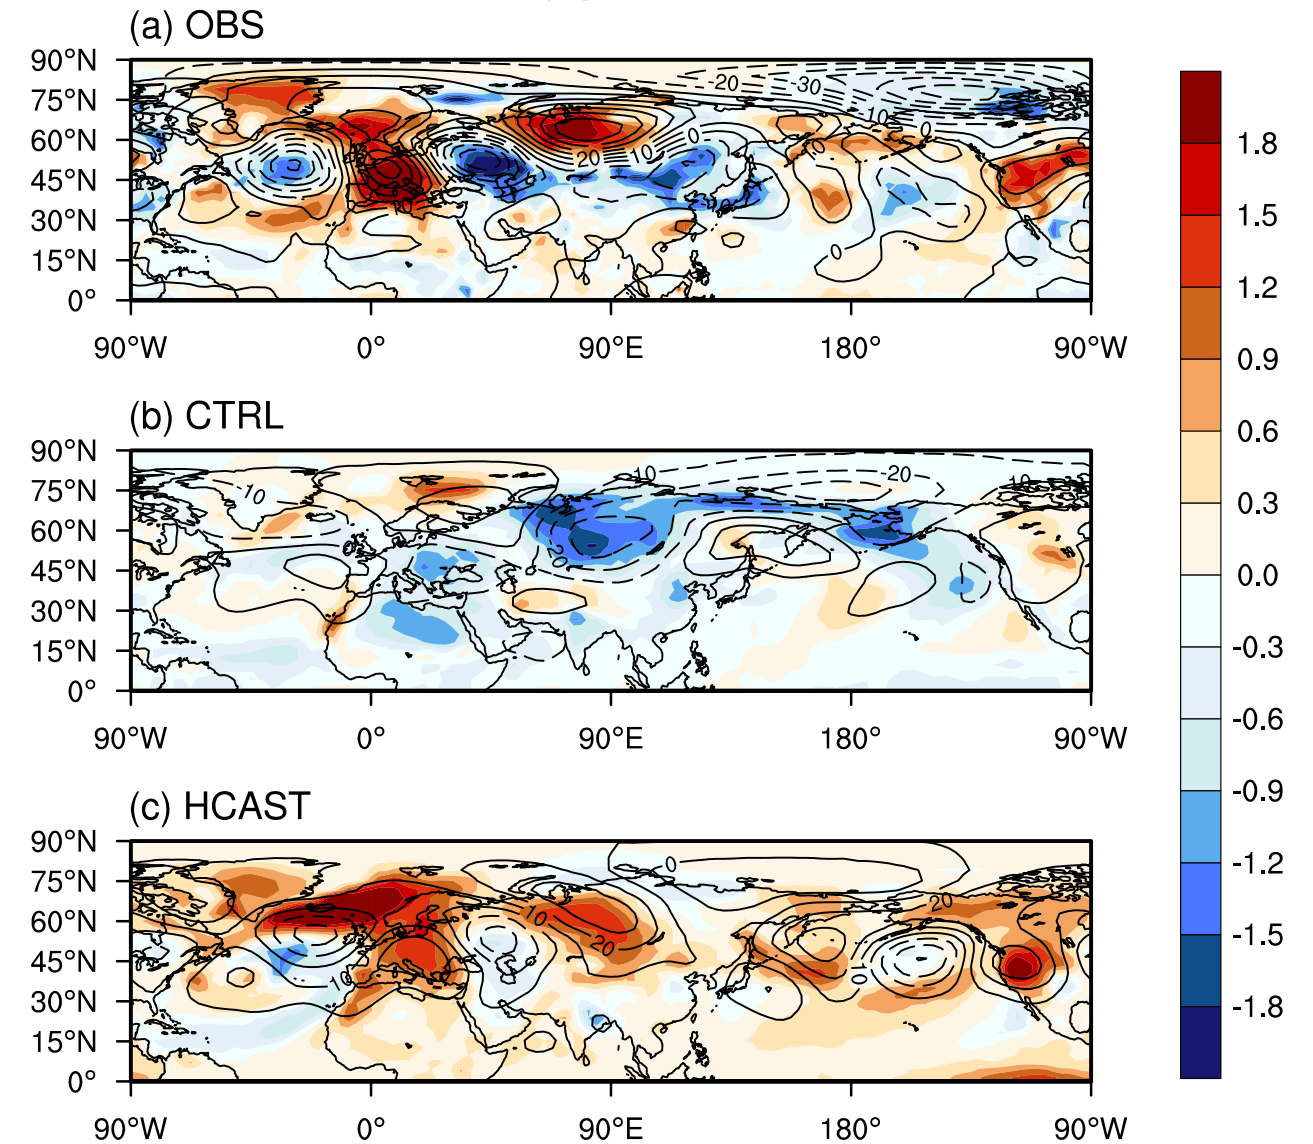

# HCAST initialized in 2001 captures the 2003 European summer heatwave and associated Rossby wavetrains

## FGOALS

## E3SMv2

# Hindcast sensitivity experiments to isolate the sources of predictability

Pattern correlation of surface temperature over Europe in 2003

Experiment	Atmosphere	Land	Ocean	PCC
HCAST	ASSIM	ASSIM	ASSIM	<b>0.82</b>
SNS1	ASSIM	CTRL	ASSIM	-0.21
SNS2	ASSIM	ASSIM only over Tibetan Plateau	ASSIM	<b>0.80</b>
SNS3	CTRL	ASSIM only over Tibetan Plateau	CTRL	<b>0.56</b>
SNS4	CTRL	ASSIM only over Tibetan Plateau	ASSIM	<b>0.65</b>
SNS5	ASSIM	ASSIM only over Tibetan Plateau	CTRL	<b>0.55</b>
SNS6	CTRL	CTRL	ASSIM	-0.41

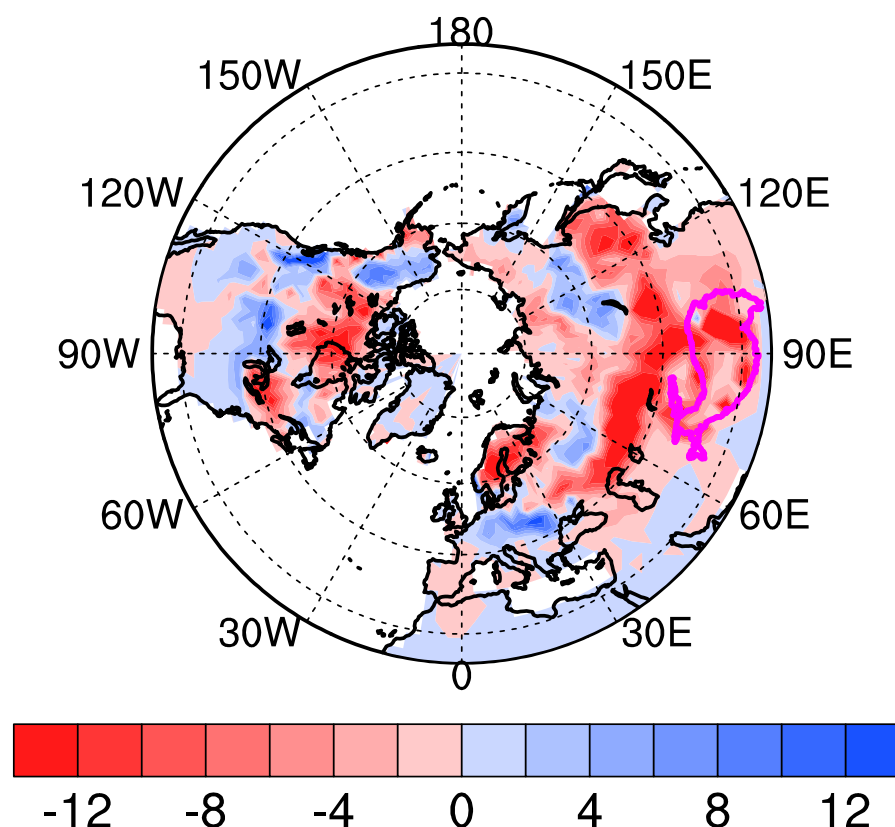

} Impact of land

} Impact of ocean

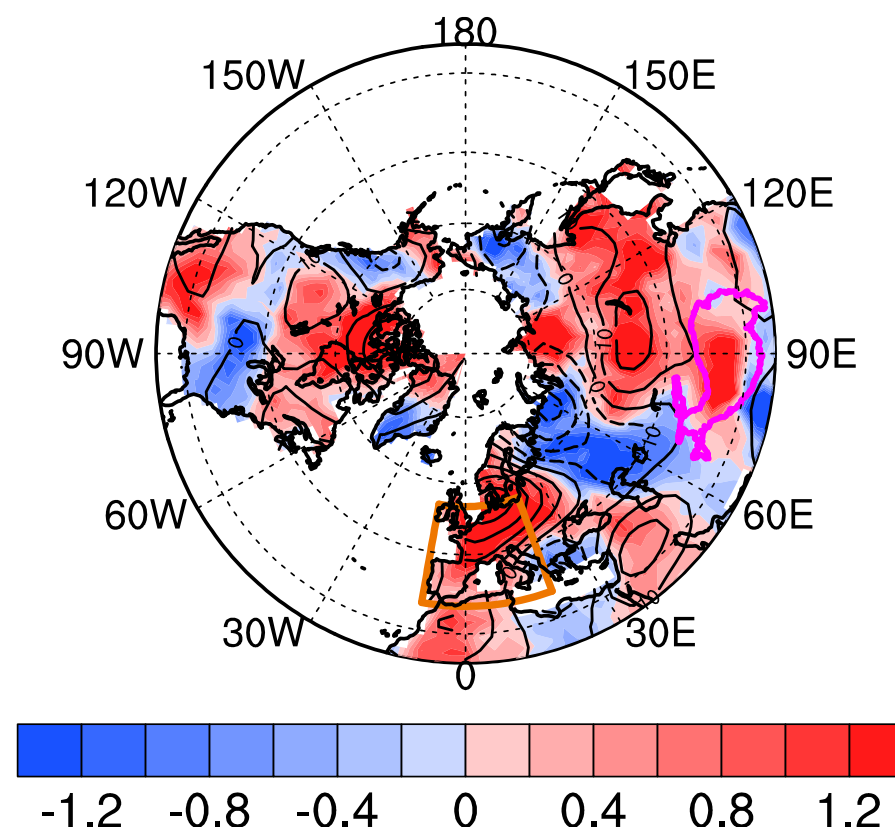

## Large differences in snow cover and surface temperature in hindcasts initialized using land states from CTRL vs. ASSIM

Reduced snow cover and warmer surface temperature over the Tibetan Plateau in 2003 spring when initialized from ASSIM in 2001

(a) Snow Cover Fraction (shaded)

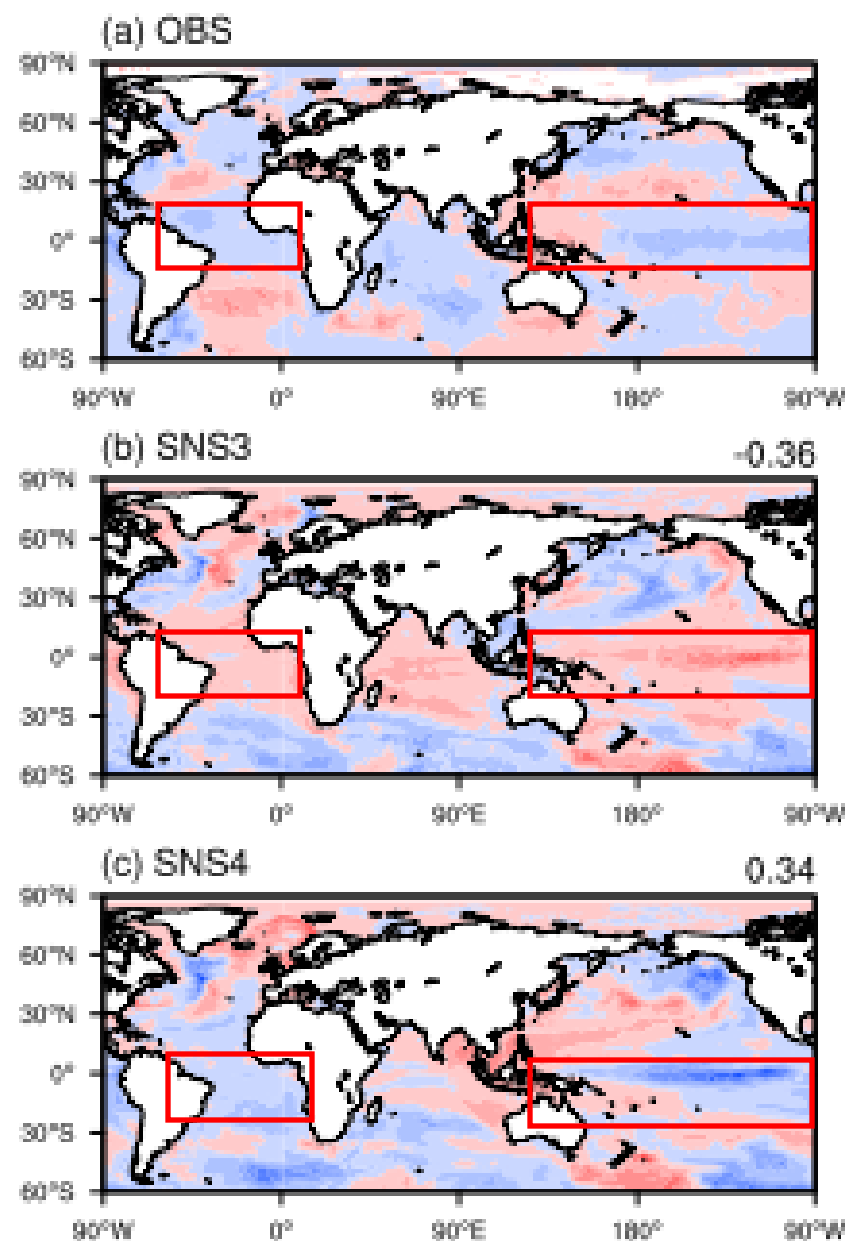

(b) T2m (shaded) & H500 (contour)

# Large differences in the SST in hindcasts initialized using ocean states from CTRL vs. ASSIM in 2001 and persist through 2003

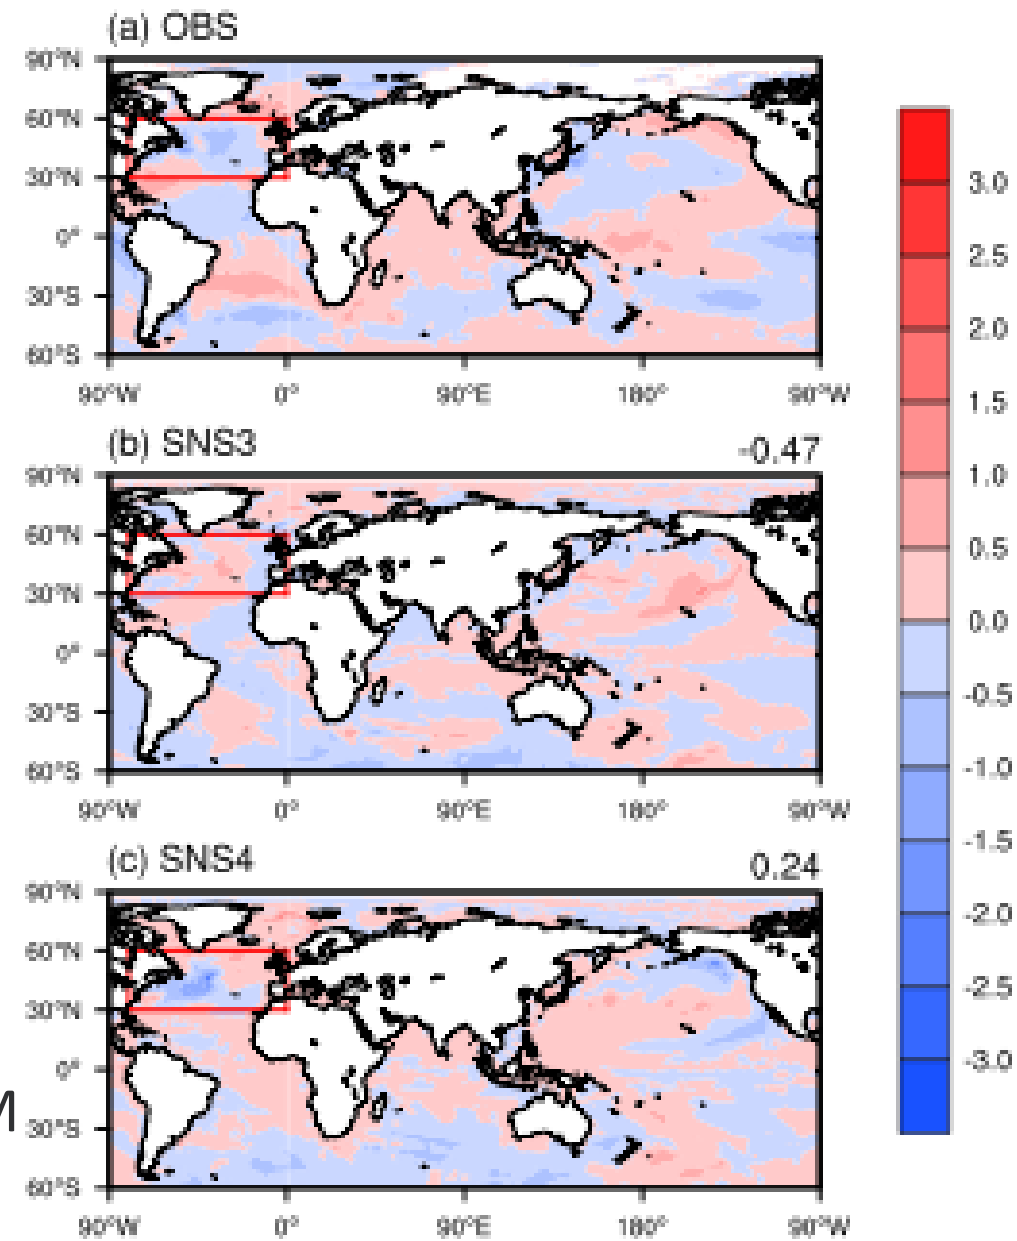

## SST anomalies in January 2001

Ocean  
initialized  
from CTRL

Ocean  
initialized

# Assimilating soil moisture/temperature in ASSIM significantly constrains AMO and NAO

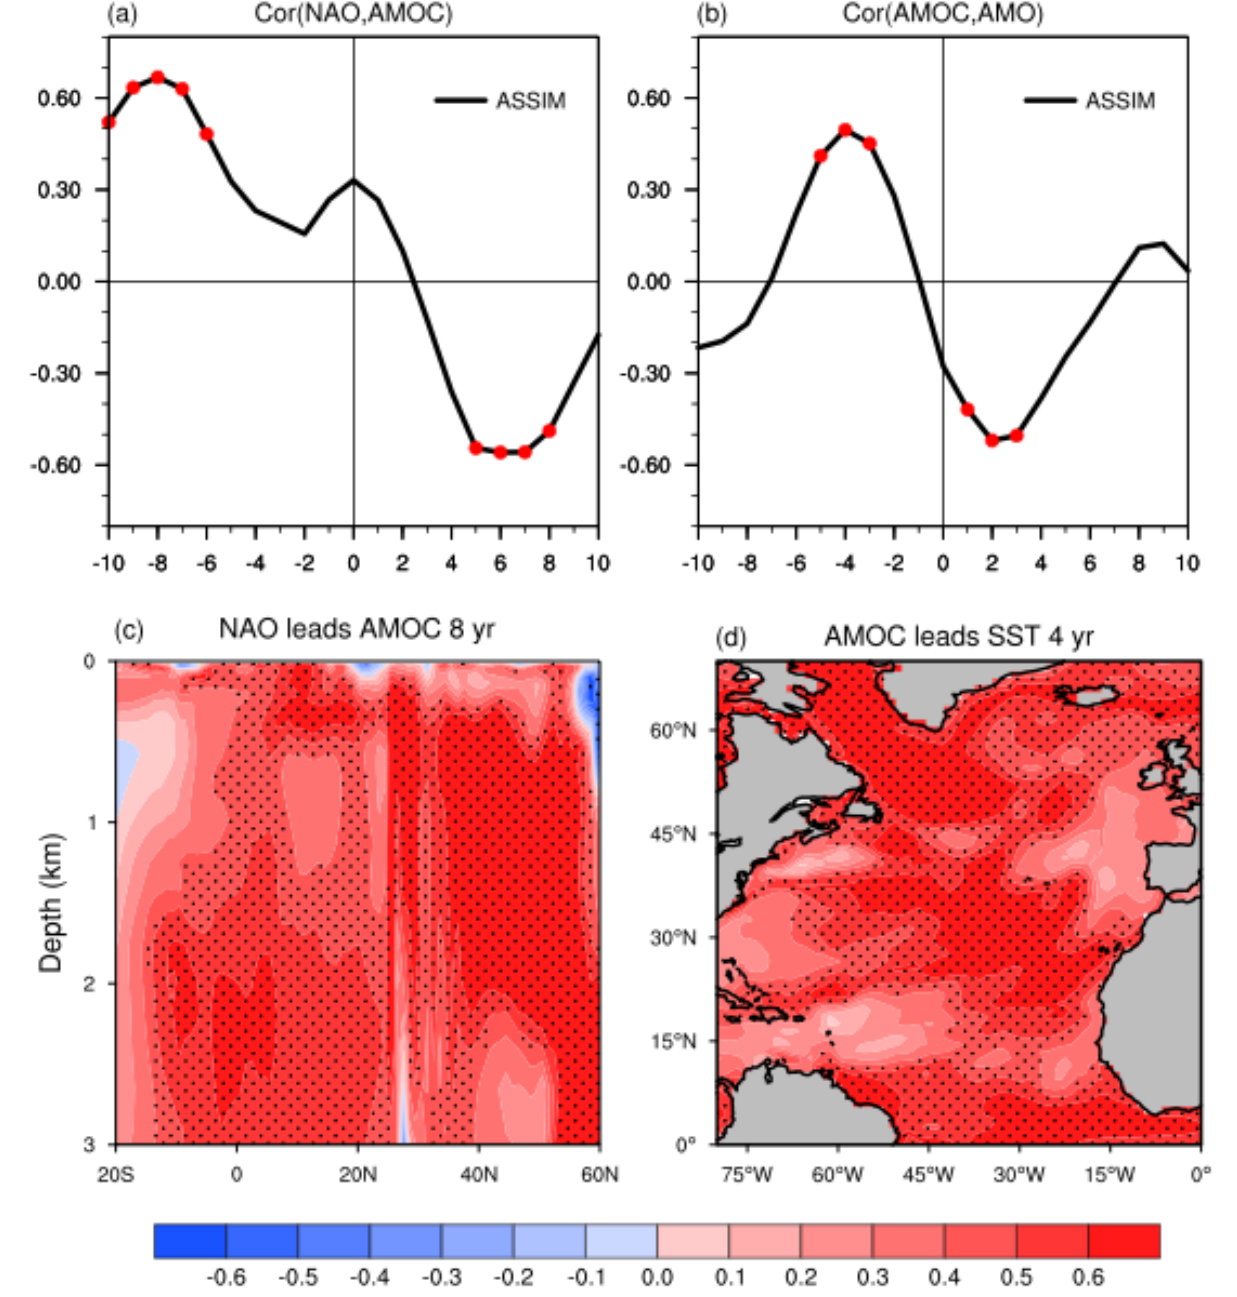

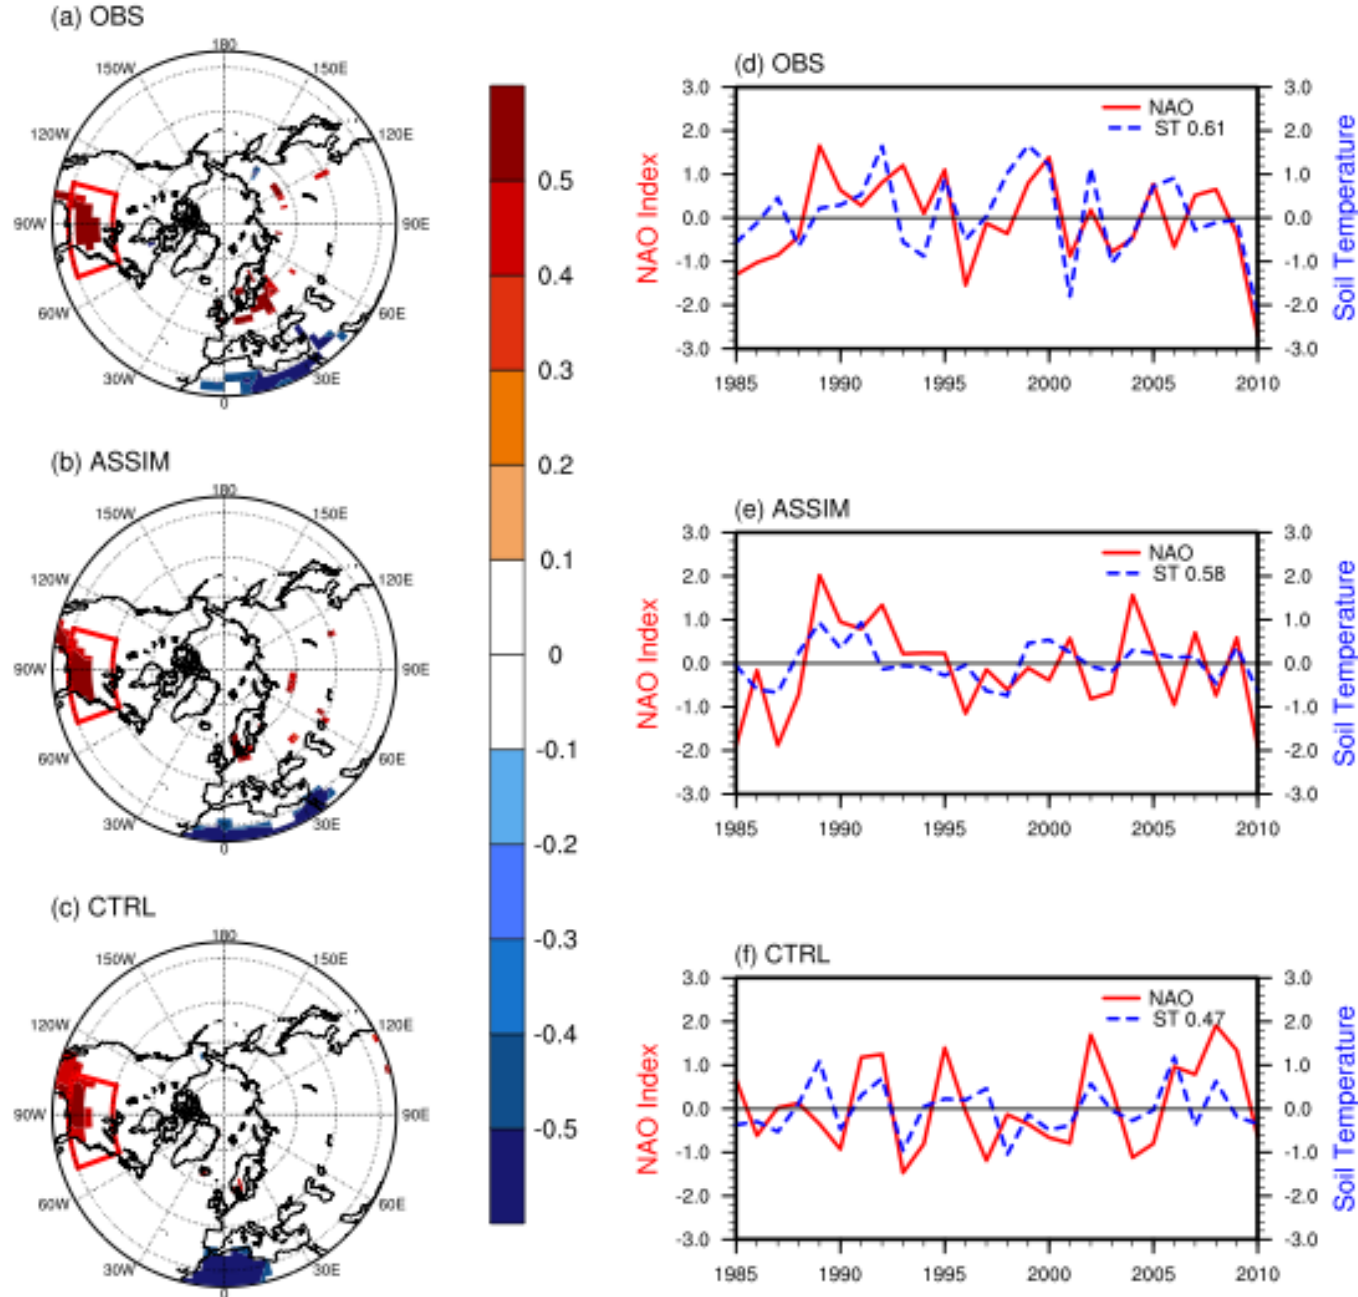

## NAO index and EOF1

### AMO index

# Connecting land states with AMO through NAO and AMOC

# Summary and concluding thoughts

- Land states can provide important S2D predictability:
  - In high mountains such as the Tibetan Plateau and the Rocky Mountains, surface heating at high altitude can effectively induce Rossby waves and teleconnections to remote land and oceans
  - At low elevation, land states may induce teleconnections through changes in surface pressure gradients
- Elements to realize the predictability associated with land states:
  - Reducing initial shock through 4DEnVar
  - Reasonable model representation of atmosphere-land-ocean interactions
  - Future work: (1) use AI to isolate the relative contributions of land and ocean to S2D predictability; (2) use ML to emulate the innovations using training data from 4DEnVar; (3) evaluate the impacts of model resolution; (4) use both physical models and ML emulators for predictions

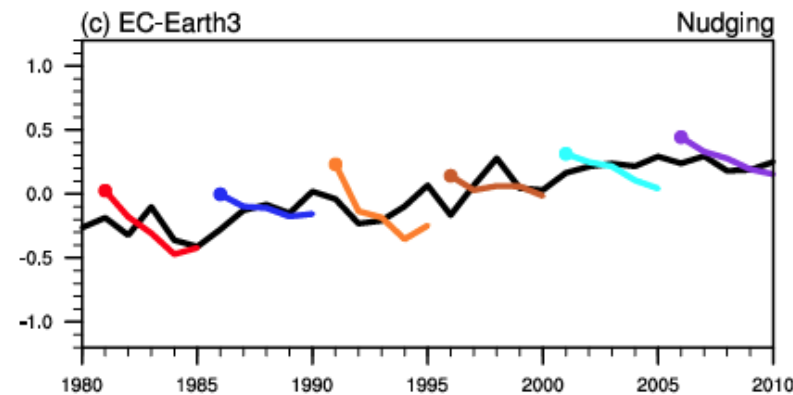

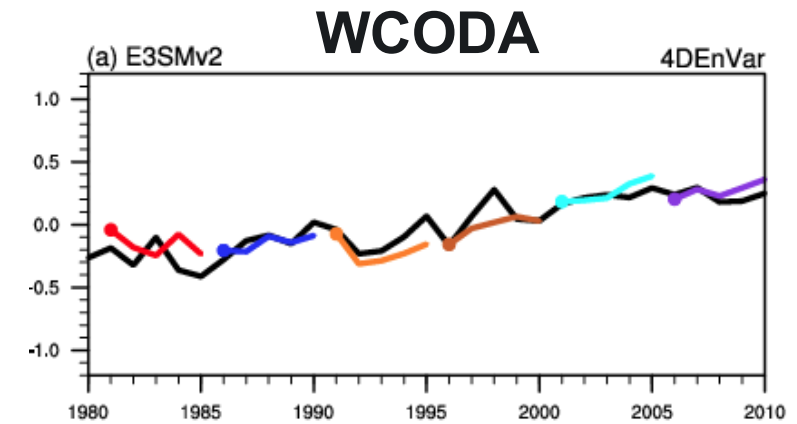

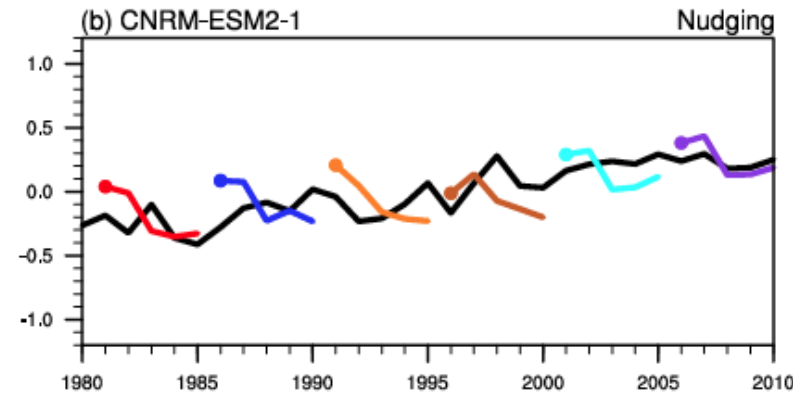

# Thank you

# Model drift in hindcasts with data assimilation

## Annual global mean surface air temperature anomalies

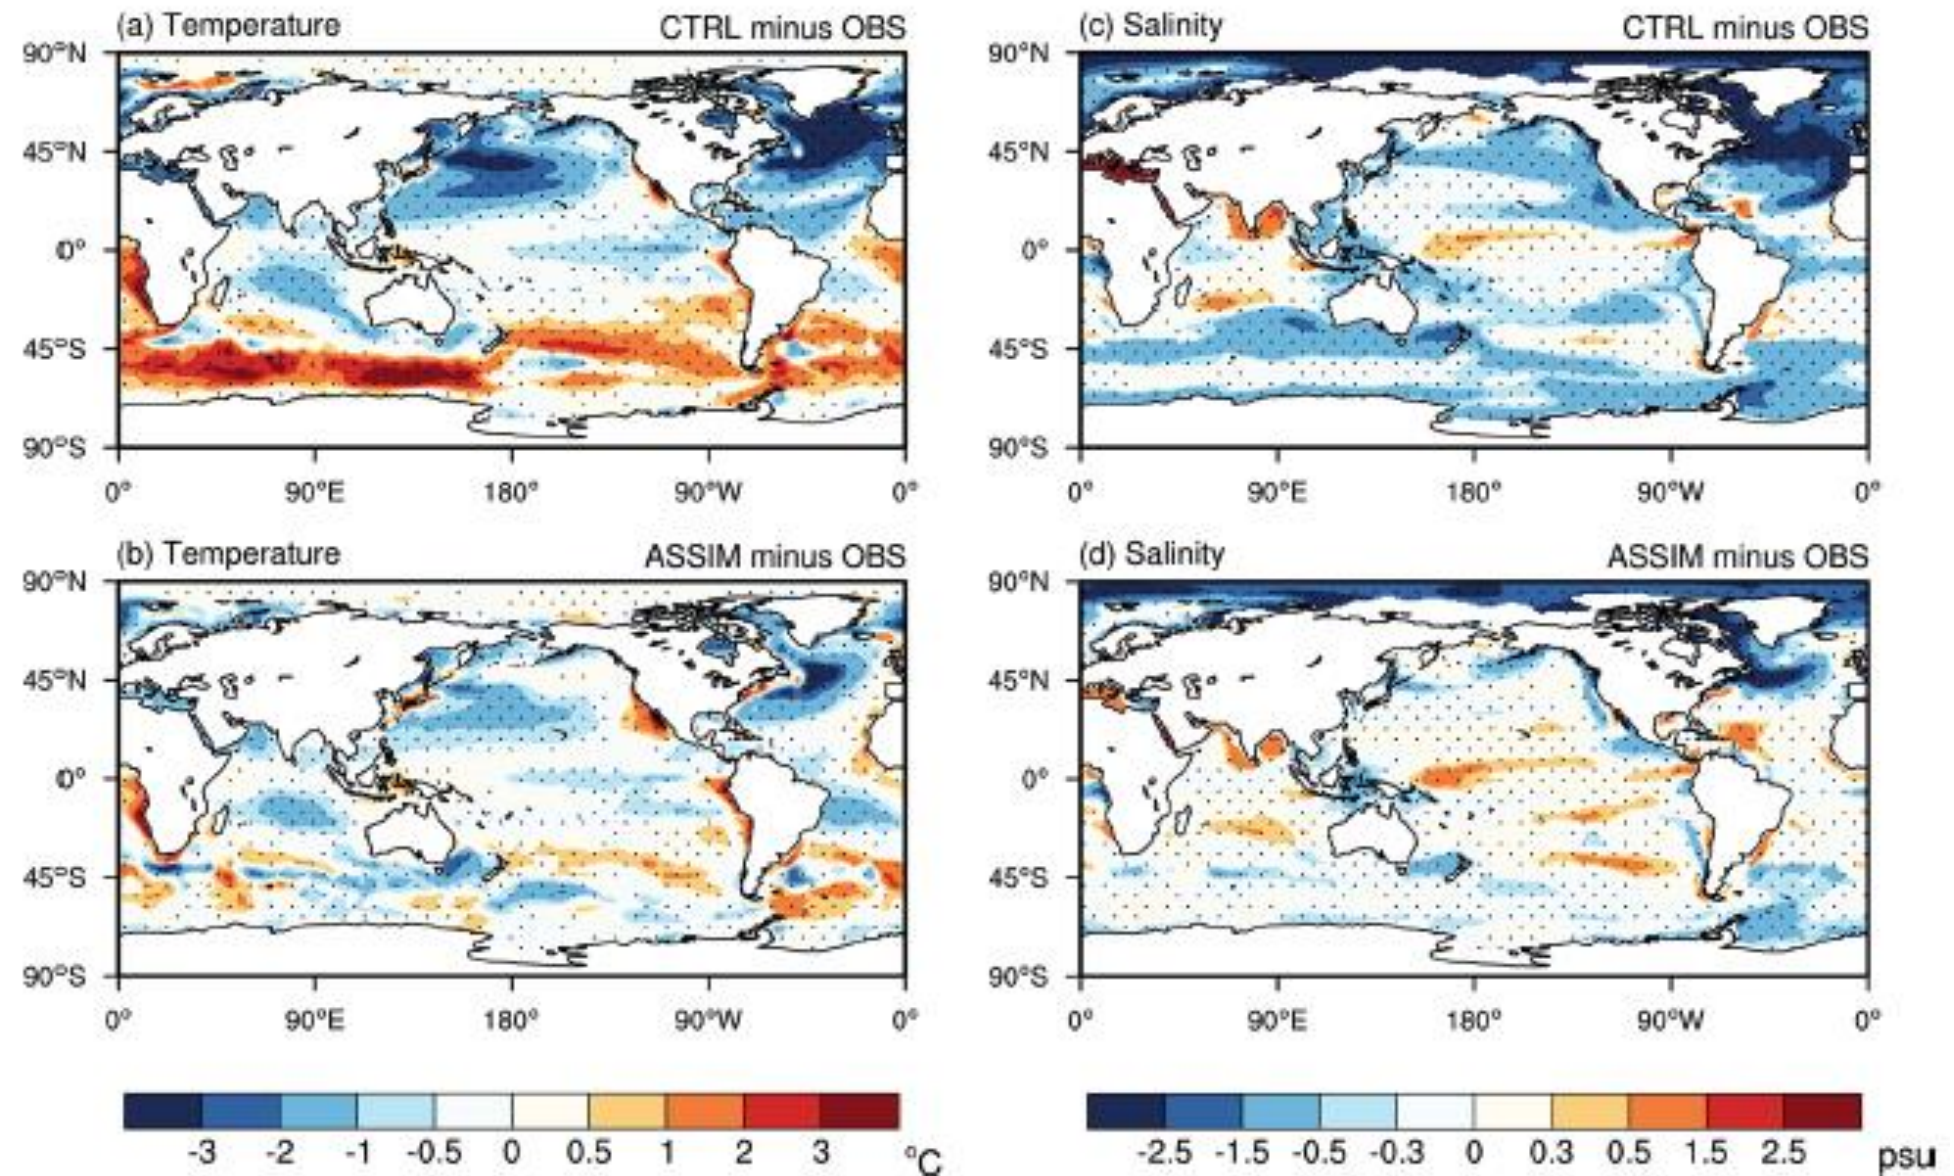

Black: observations  
Colored: mean of three hindcast  
members initialized on Sep, Nov,  
Jan of different start years

# A weakly coupled ocean data assimilation system (WCODA) has also been implemented in E3SMv2

Ocean temperature and salinity from EN4.2.1 ocean reanalysis

(Shi et al. 2025 GMD)

# E3SM modeling across components and scales

Three versions of E3SM have been developed since 2014

Model component	Lower resolution (LR)	High resolution (HR)	Cloud-resolving (SCREAM)	Regional refined model (RRM)
Atmosphere & Land	100 km	25 km	3 km	variable
Ocean & Ice	30-60 km	6-18 km	prescribed	variable
River	50 km	12 km	3 – 12 km	variable

## North America RRM

25 km → 100 km

14 km → 60 km

## Southern Ocean RRM

# Global cloud-resolving modeling

- The Simple Cloud-Resolving E3SM Atmosphere Model (SCREAM) solves the fluid dynamics using a non-hydrostatic spectral element dynamical core (Taylor et al. 2020)
- The horizontal dynamical grid is a cubed sphere grid with 1024x1024 spectral elements (ne1024 ~ 3.25 km resolution) with 128 vertical levels and a model top at 40 km
