Southern Ocean Carbon and Climate Observations and Modeling

SOCCOM

The grand challenge

Scientific rationale: the role of the Southern Ocean in carbon and climate

The Southern Ocean south of 30°S accounts for

- Nutrients supporting three-quarters of biological production north of 30°S
- Half of the current anthropogenic carbon dioxide uptake by the oceans ($43 \pm 3\%$ in CMIP5 models)
- About $75\% \pm 22\%$ of excess heat uptake by the oceans (in CMIP5 models)
- Closure of the meridional overturning circulation

Model simulations suggest

- Aragonite will undersaturate in ~ 16 years (2030)
- Major changes in Southern Ocean circulation and mixing may occur in response to climate change

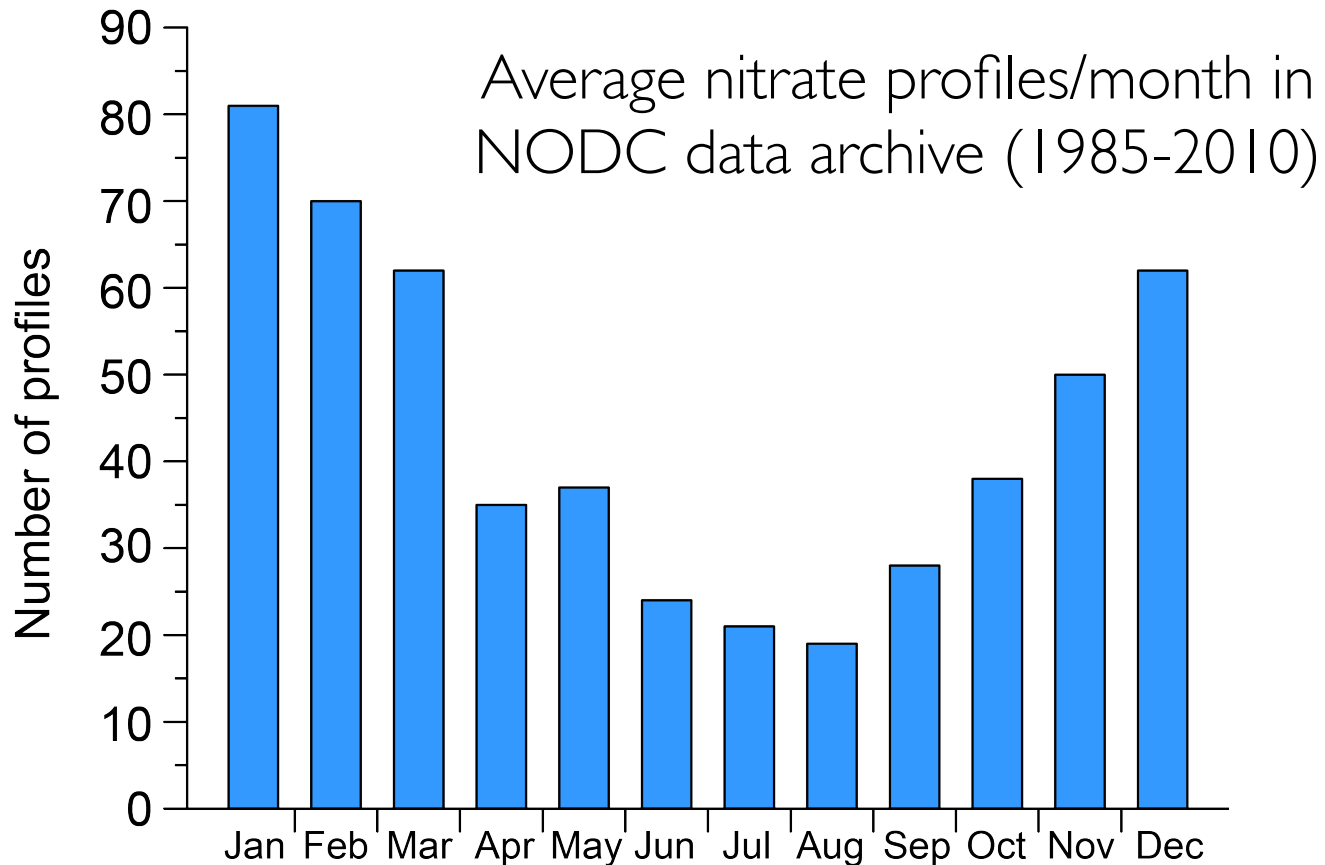

The grand challenge

- Despite its critical importance, the Southern Ocean is the least understood region of the world ocean.
 - The overturning circulation is highly uncertain
 - Eddy fluxes are poorly quantified.
 - Current climate models are unable to resolve eddies (recent eddy rich exceptions at GFDL & NCAR)
- And yet
 - It is the least observed region of the world ocean
 - We are sorely lacking in experts on the Southern Ocean
 - The public is largely unaware of the importance of this region

Nutrient profiles south of 30°S

NOAA

NATIONAL OCEANOGRAPHIC
DATA CENTER (NODC)
UNITED STATES DEPARTMENT OF COMMERCE

- 254,000 pH profiles from ships in US National Ocean Database.
- 55,584 pH profiles since measurements were standardized during the WOCE/JGOFS era (since 1990).

Geographic distribution of casts (2 casts)

NOAA NODC Ocean Climate Laboratory
<http://www.nodc.noaa.gov/OCL/>

For 1990 – 2014 there are **only 2 pH profiles** found South of 40°S in the database for the Austral Winter (June 21- Sep 22).

COPY OF YOUR SEARCH CRITERIA:

OBSERVATION DATES: Year from 1990 to 2014; Month from 6 to 9; Day from 21 to 22

GEOGRAPHIC COORDINATES: Longitude from -180.0000 to 180.0000; Latitude from -40.0000 to -90.0000

DATASET: OSD,CTD,XBT,MBT,PFL,DRB,MRB,APB,UOR,SUR,GLD

MEASURED VARIABLES (must): pH

MEASURED VARIABLES (extract): pH

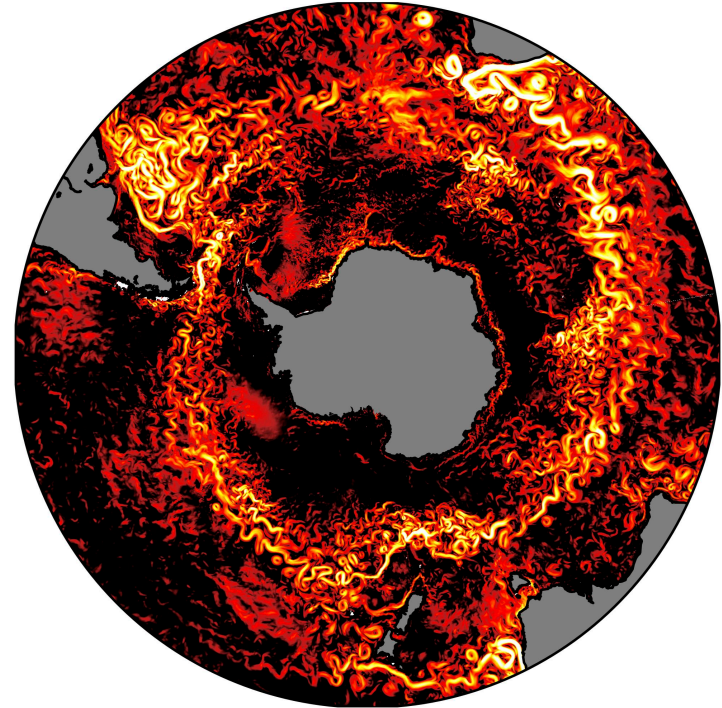

NSF
1

Current IPCC class climate models have 1° horizontal resolution

1° ocean resolution
(GFDL CM2-1deg)

0.1° ocean resolution
(GFDL CM2.6)

SOCCOM

The opportunity

(I) A paradigm shift – Transformative observing system

Argo profiles for 1 month
Aug 15-Sep 15, 2012
(1193 profiles)

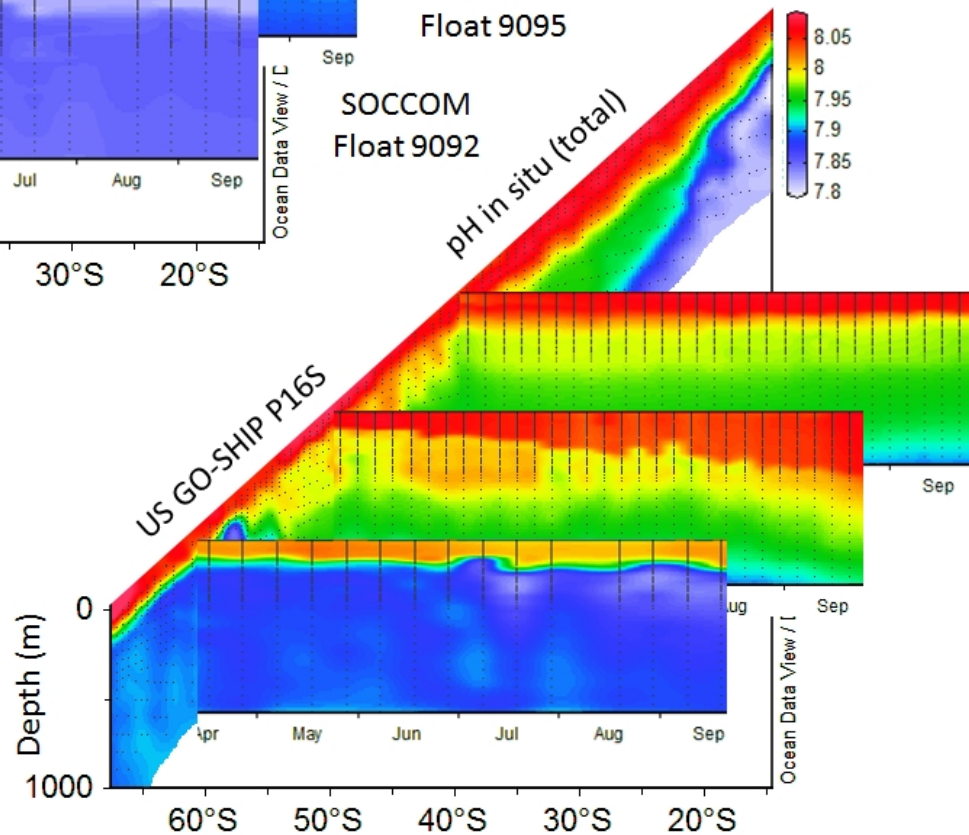

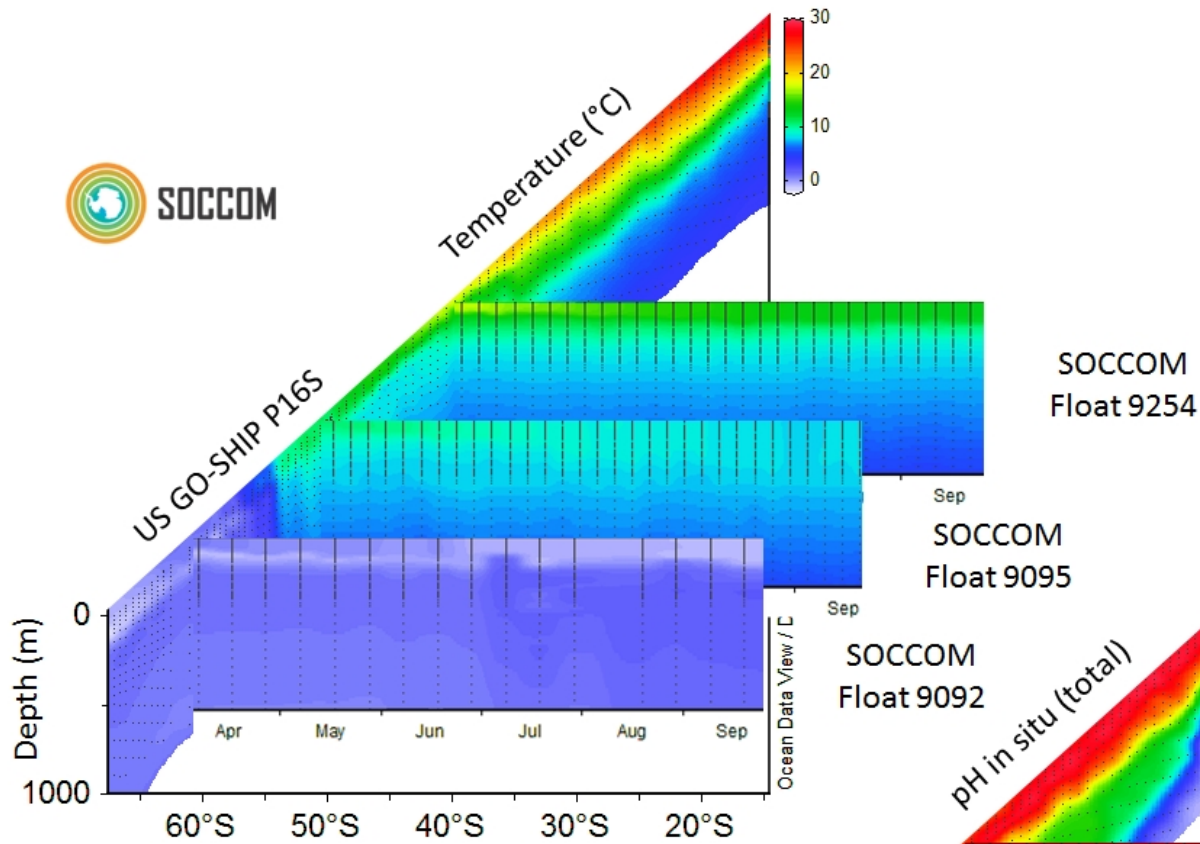

- Argo floats (currently measuring only temperature & salinity)
- New sensors for pH, nitrate, oxygen, and optics

SOCCOM

Results from pre-SOCCOM cruise (2014)

(2) Eddy rich-high resolution climate models

1° ocean resolution
(GFDL CM2-1deg)

0.1° ocean resolution
(GFDL CM2.6)

(3) Transformative analysis methods

- Southern Ocean State Estimation using data assimilation to produce full 4D estimates of ocean properties

SOCCOM

Southern Ocean Carbon and Climate Observations and Modeling

SOCCOM

What is
SOCCOM?

- Quantify and understand the role of all regions of the Southern Ocean in carbon cycling, acidification, nutrient cycling, and heat uptake, on seasonal, interannual, and longer time scales.
- Develop the scientific basis for projecting the contribution of the Southern Ocean to the future trajectory of carbon, acidification, nutrient cycling, and heat uptake.

To pursue our vision we have brought together a multi-institutional, trans-disciplinary team organized along three overarching themes:

- innovative and sustained *observations* of the carbon cycle Theme I
- eddy rich high resolution Earth System Models Theme II
- a comprehensive *outreach* program Broader Impacts

- **Objective 1: (Theme 1):** To develop a new observing system for carbon, nutrients, and oxygen based on ~200 biogeochem floats
- **Objective 2: (Theme 1, Theme 2):** To produce an unprecedented 3-dimensional space and time resolved estimate of Southern Ocean biogeochemistry based on SOSE
- **Objective 3: (Theme 2):** To create new assessment tools for high-resolution and Earth System Model simulations.
- **Objective 4: (Theme 2):** To encourage the climate modeling community to use the newly created assessment tools by developing a protocol for an international, model intercomparison program (SOMIP).
- **Objective 5: (Theme 1, Theme 2):** To promote the development of improved parameterizations for the next generation of climate models.

Nutrient profiles south of 30°S

Yellow - Ice, Green Nitr+O2+pH, Pink O2+pH

Pre-SOCCOM BGC floats deployed

SOCCOM array will be circum-polar. Deployments will depend on collaborative cruise opportunities. Coordinated by Lynne Talley, SIO.
