Spatial  
Distributions

Sensitivity

Future Work

## Model 1: GFDL-HiRAM (Zhao et al. 2009)

- ▶ 50 km horizontal grid spacing
- ▶ 32 vertical levels
- ▶ Forced with HadISST from 1981-2008
- ▶ Global

## Model 2: FSU-COAPS (LaRow et al. 2008)

- ▶ Spectral model with T126 horizontal resolution
- ▶ 27 vertical levels
- ▶ Forced with HadISST from 1981-2008
- ▶ Use data from North Atlantic basin

# Spatial Distribution Summary:

## Globally

- ▶ The overall spatial distribution of TCs generated by the GFDL-HiRAM matches reasonably well with observations, although there are clear areas of over/under prediction by the model.
- ▶ Quantitative performance metrics verify that the GFDL-HiRAM is generally generating TCs in the correct areas.

## North Atlantic

- ▶ There are significant areas of overprediction by the FSU-COAPS model in the central portion of the basin.
- ▶ Interestingly, neither model correctly reproduces the spatial distribution of storms in the Caribbean and Gulf of Mexico.

# Sensitivity Summary:

US CLIVAR  
Hurricane  
Workshop, 5 June  
2013

**Sarah E. Strazzo,**  
James B. Elsner,  
Timothy E.  
LaRow, Ming  
Zhao, and Daniel  
J. Halperin

- ▶ Sensitivity of limiting intensity to SST
  - ▶ Observations:  $7.9 \pm 1.19 \text{ m s}^{-1} \text{ K}^{-1}$
  - ▶ GFDL-HiRAM (unadjusted):  $1.8 \pm 0.42 \text{ m s}^{-1} \text{ K}^{-1}$
  - ▶ GFDL-HiRAM (adjusted):  $6.9 \pm 3.33 \text{ m s}^{-1} \text{ K}^{-1}$
  - ▶ FSU-COAPS:  $2.9 \pm 2.64 \text{ m s}^{-1} \text{ K}^{-1}$
- ▶ Sensitivities from model-generated data are significantly lower than those from observations

Introduction

Data and Spatial  
Framework

Spatial  
Distributions

Sensitivity

Future Work

- ▶ Add more models for a comprehensive intercomparison
- ▶ Examine relationships between sensitivity and climate (e.g., ENSO, relative SST)
- ▶ Explore the use of Bayesian models to examine regional and temporal relationships between LI and SST
