Introduction

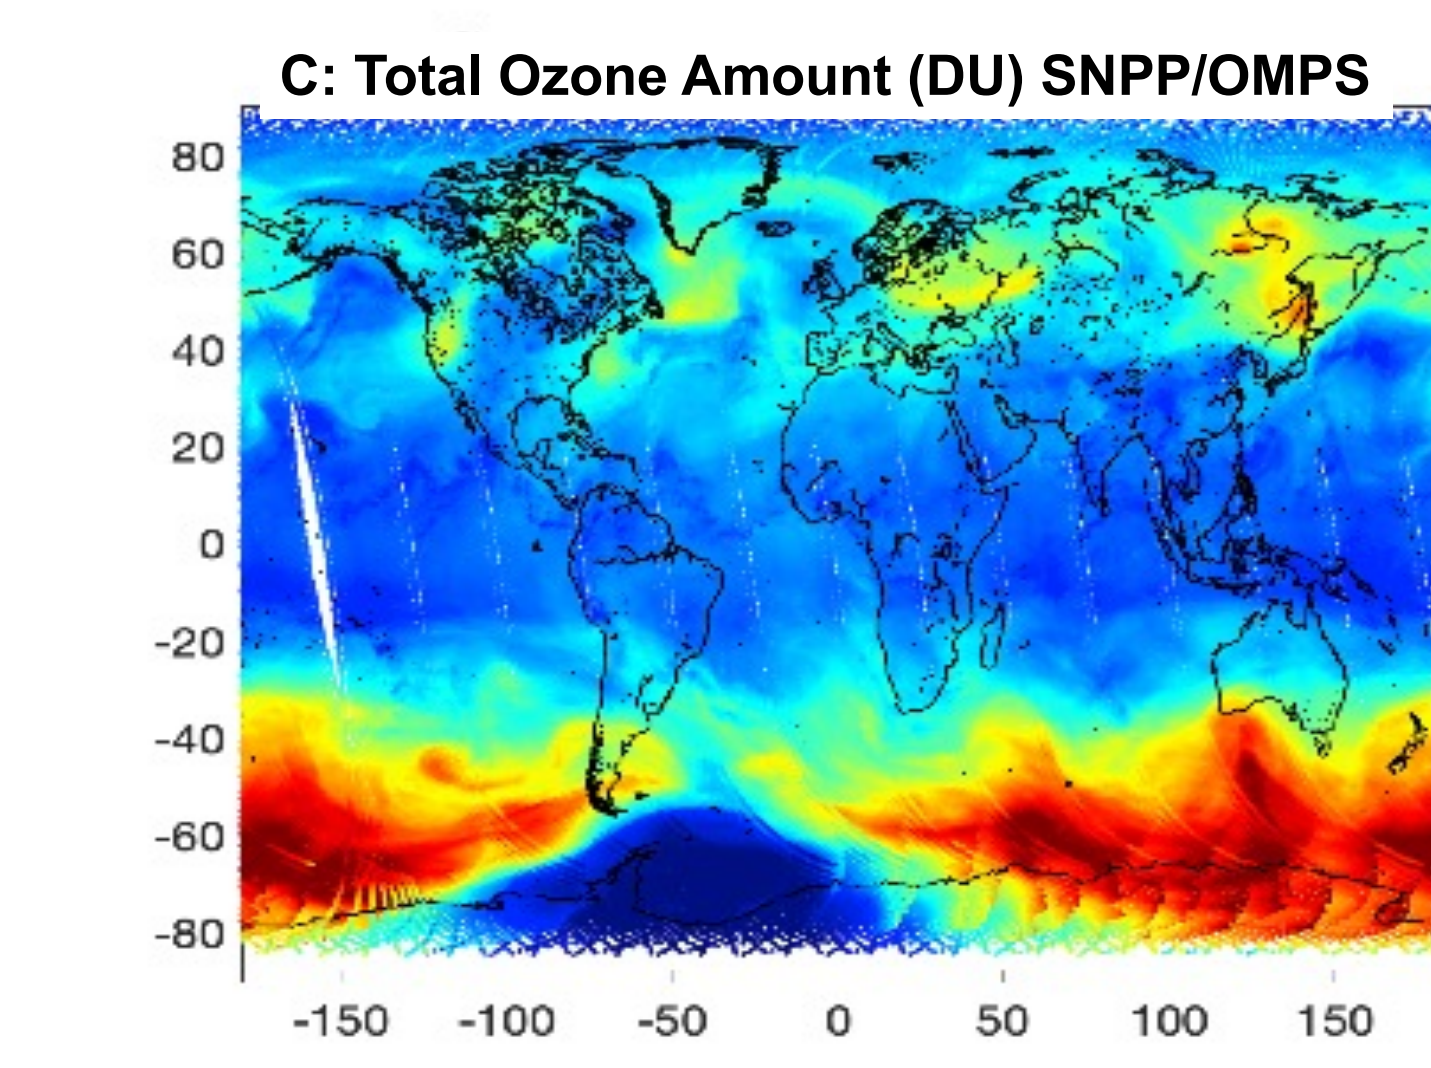

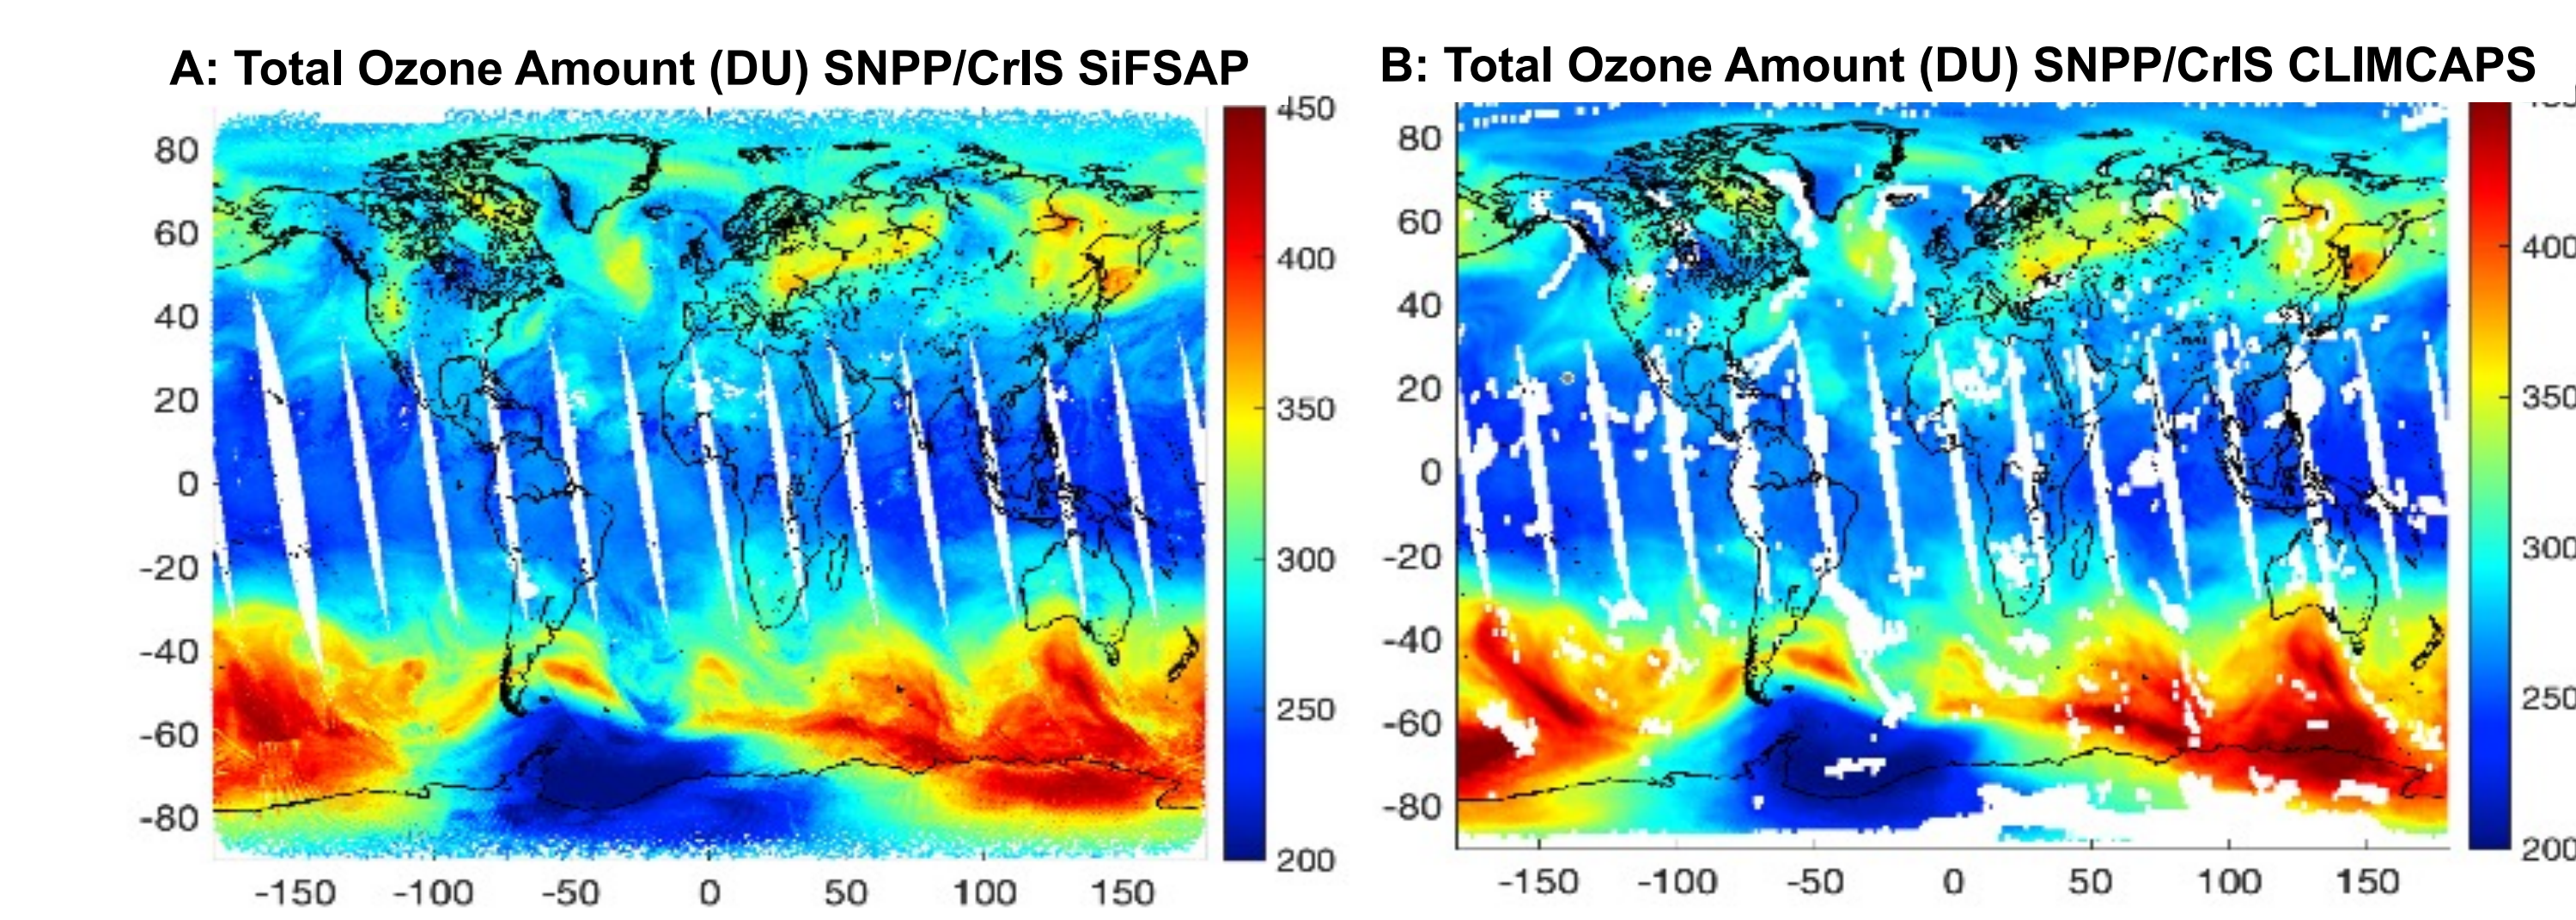

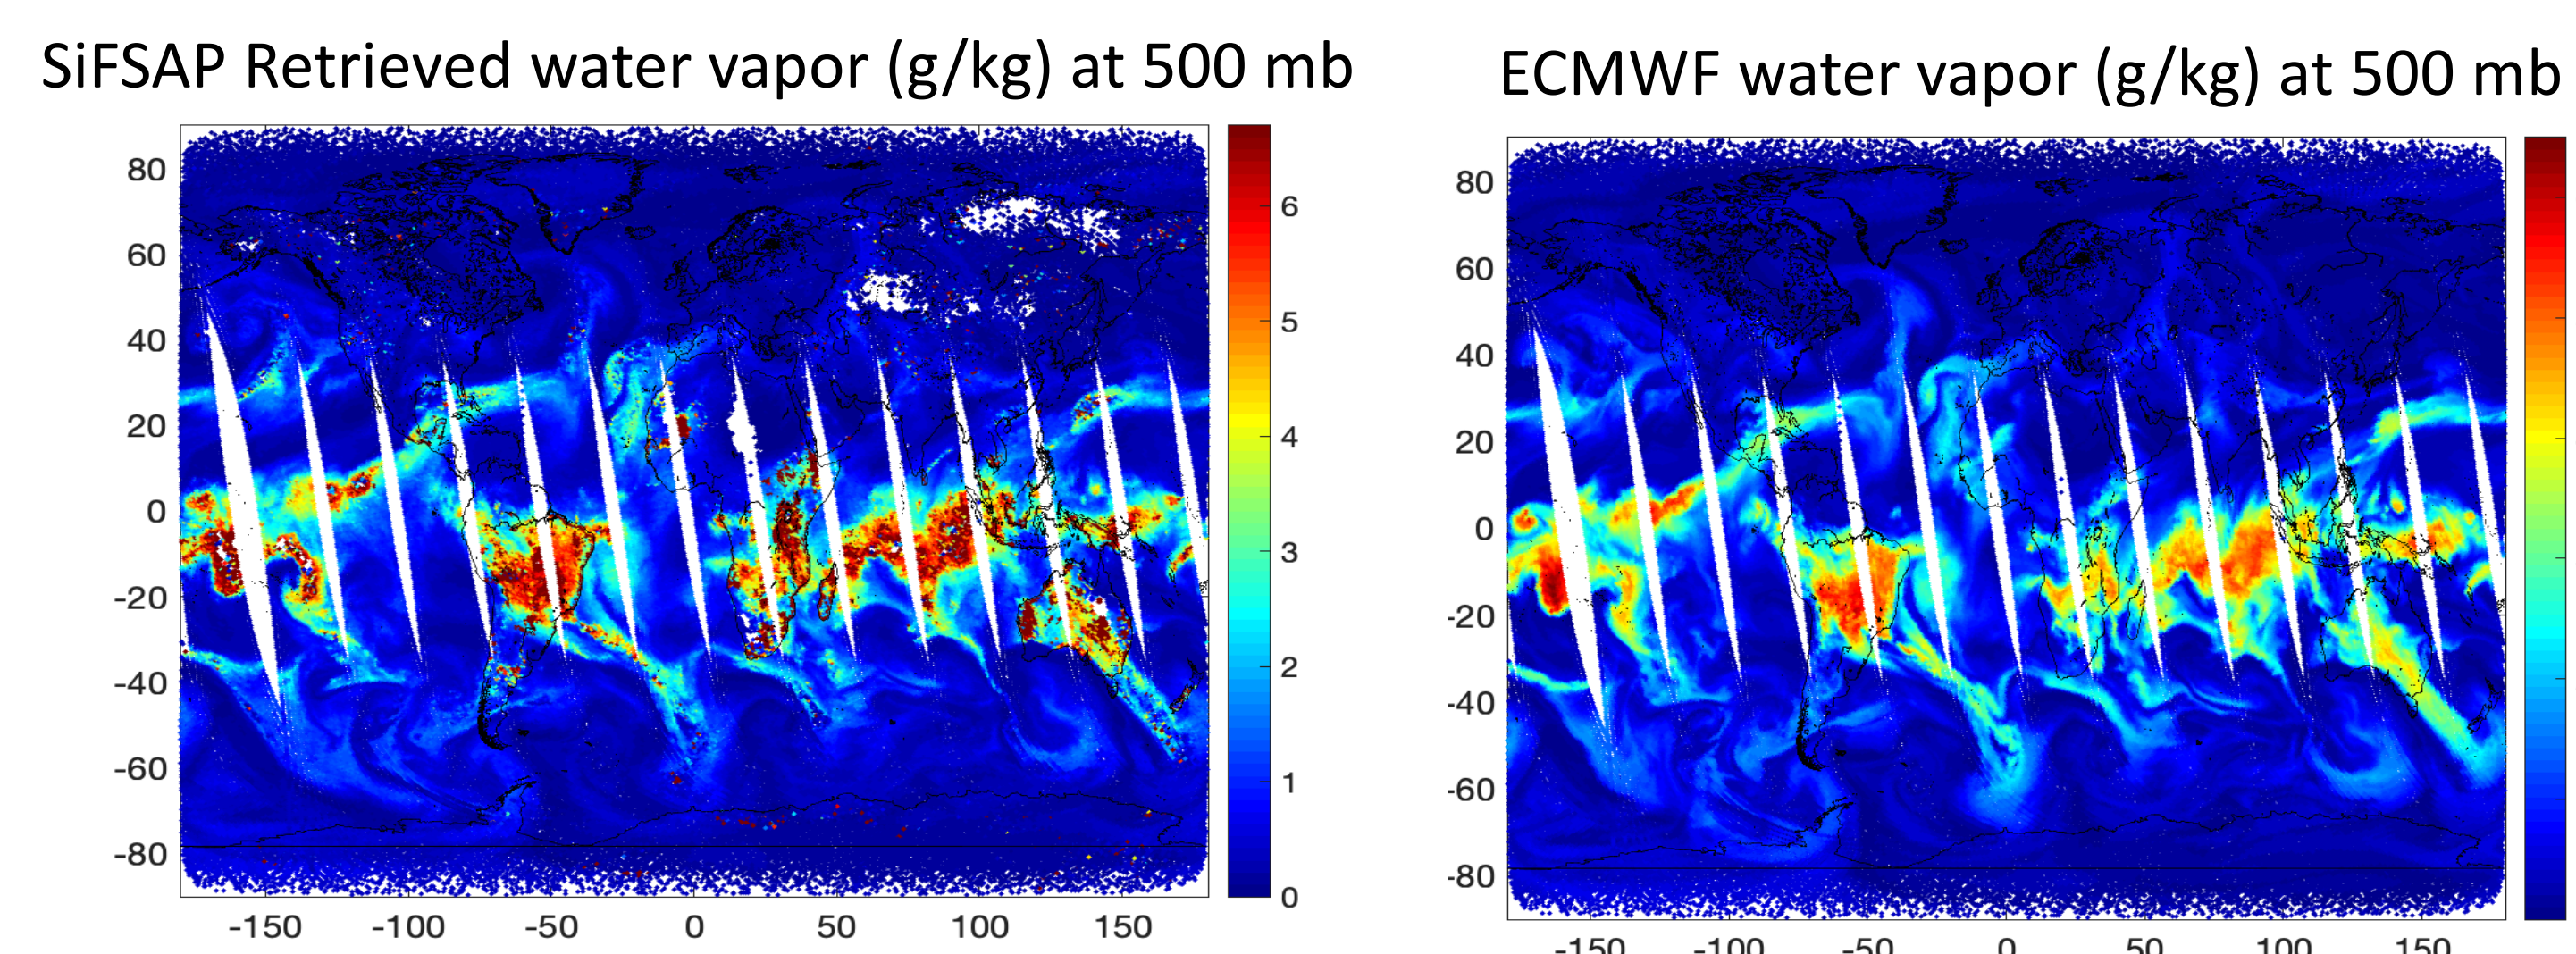

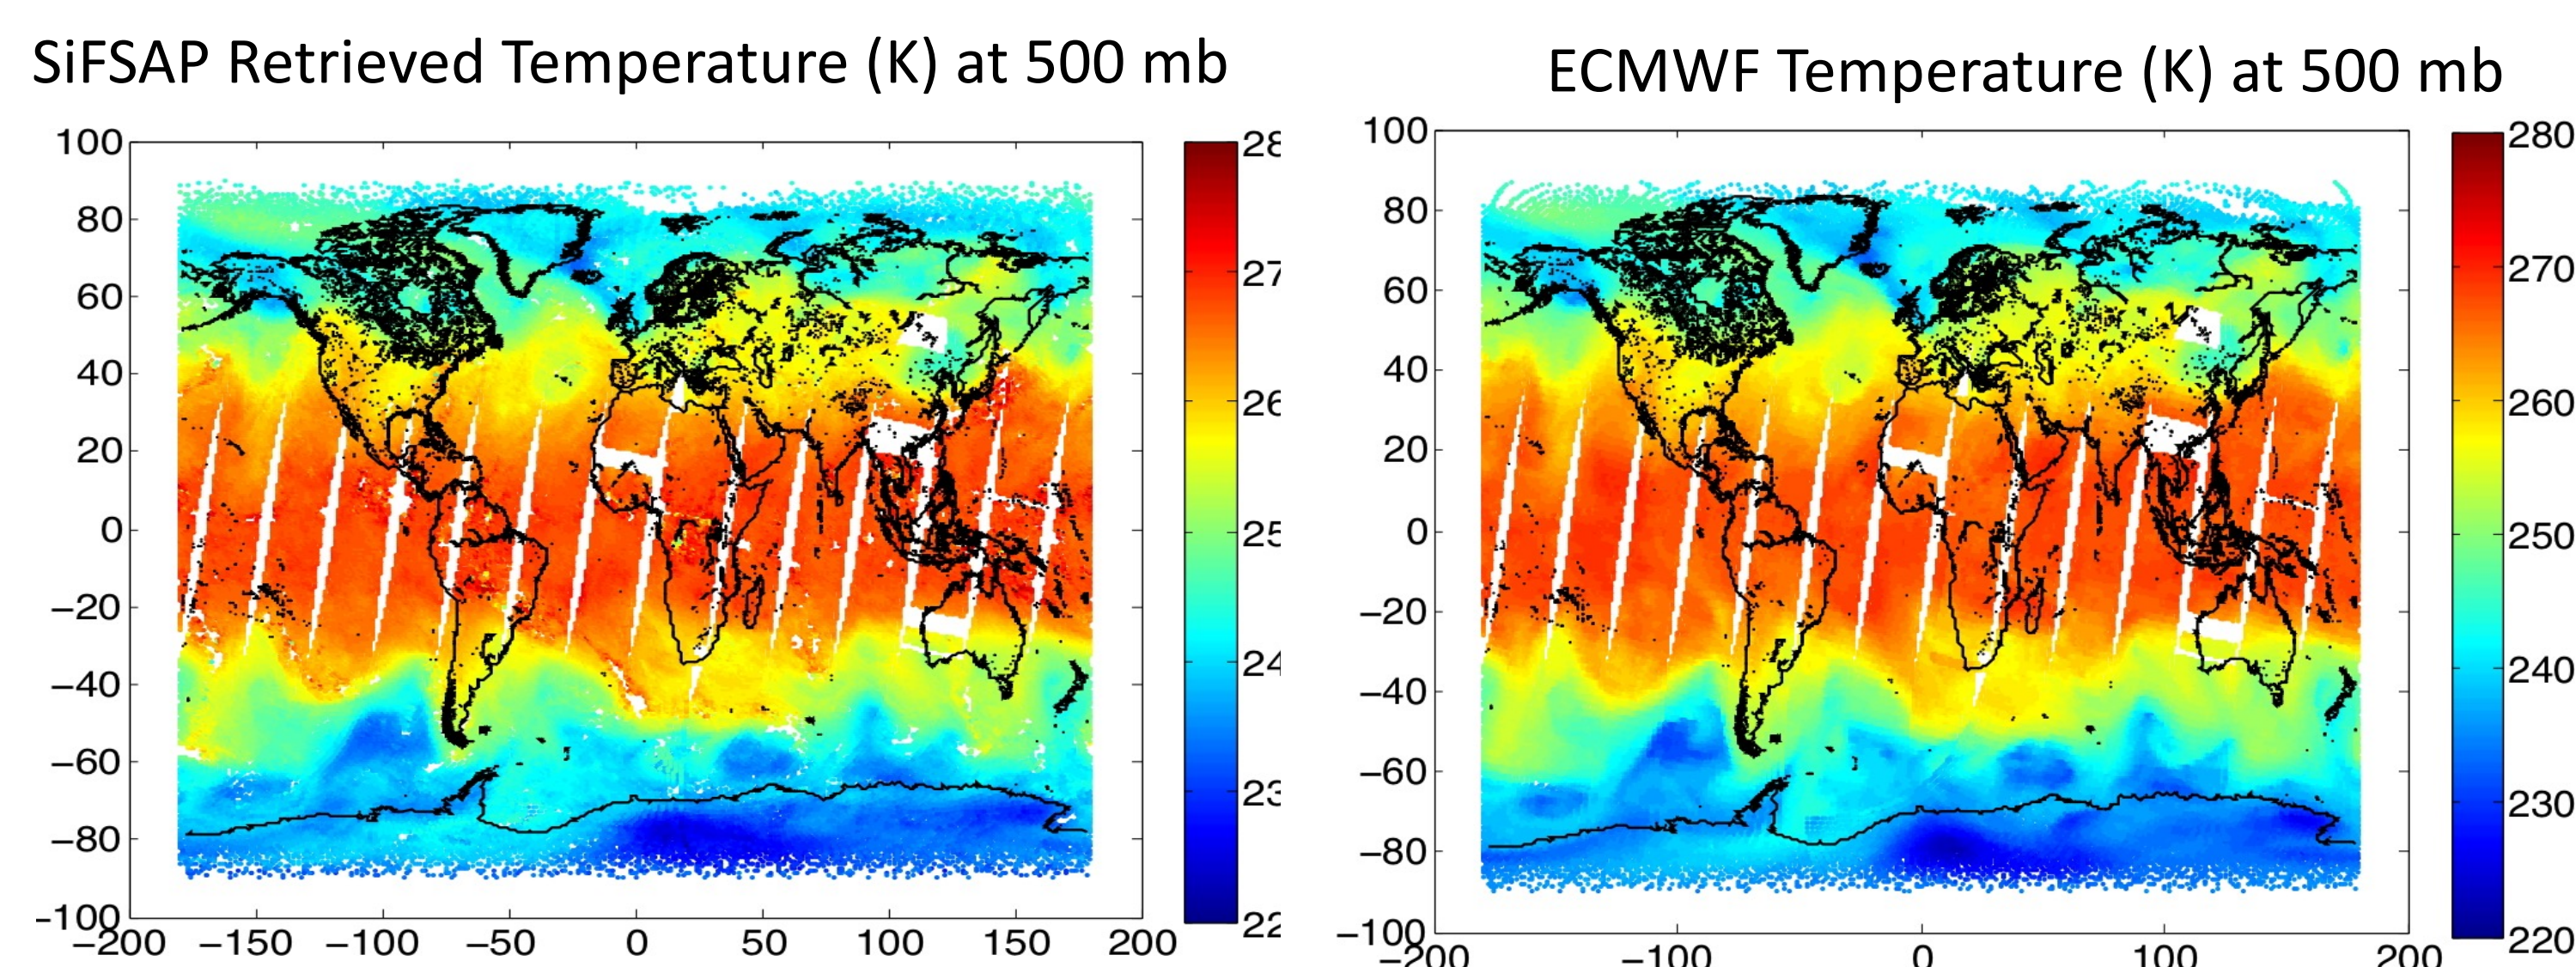

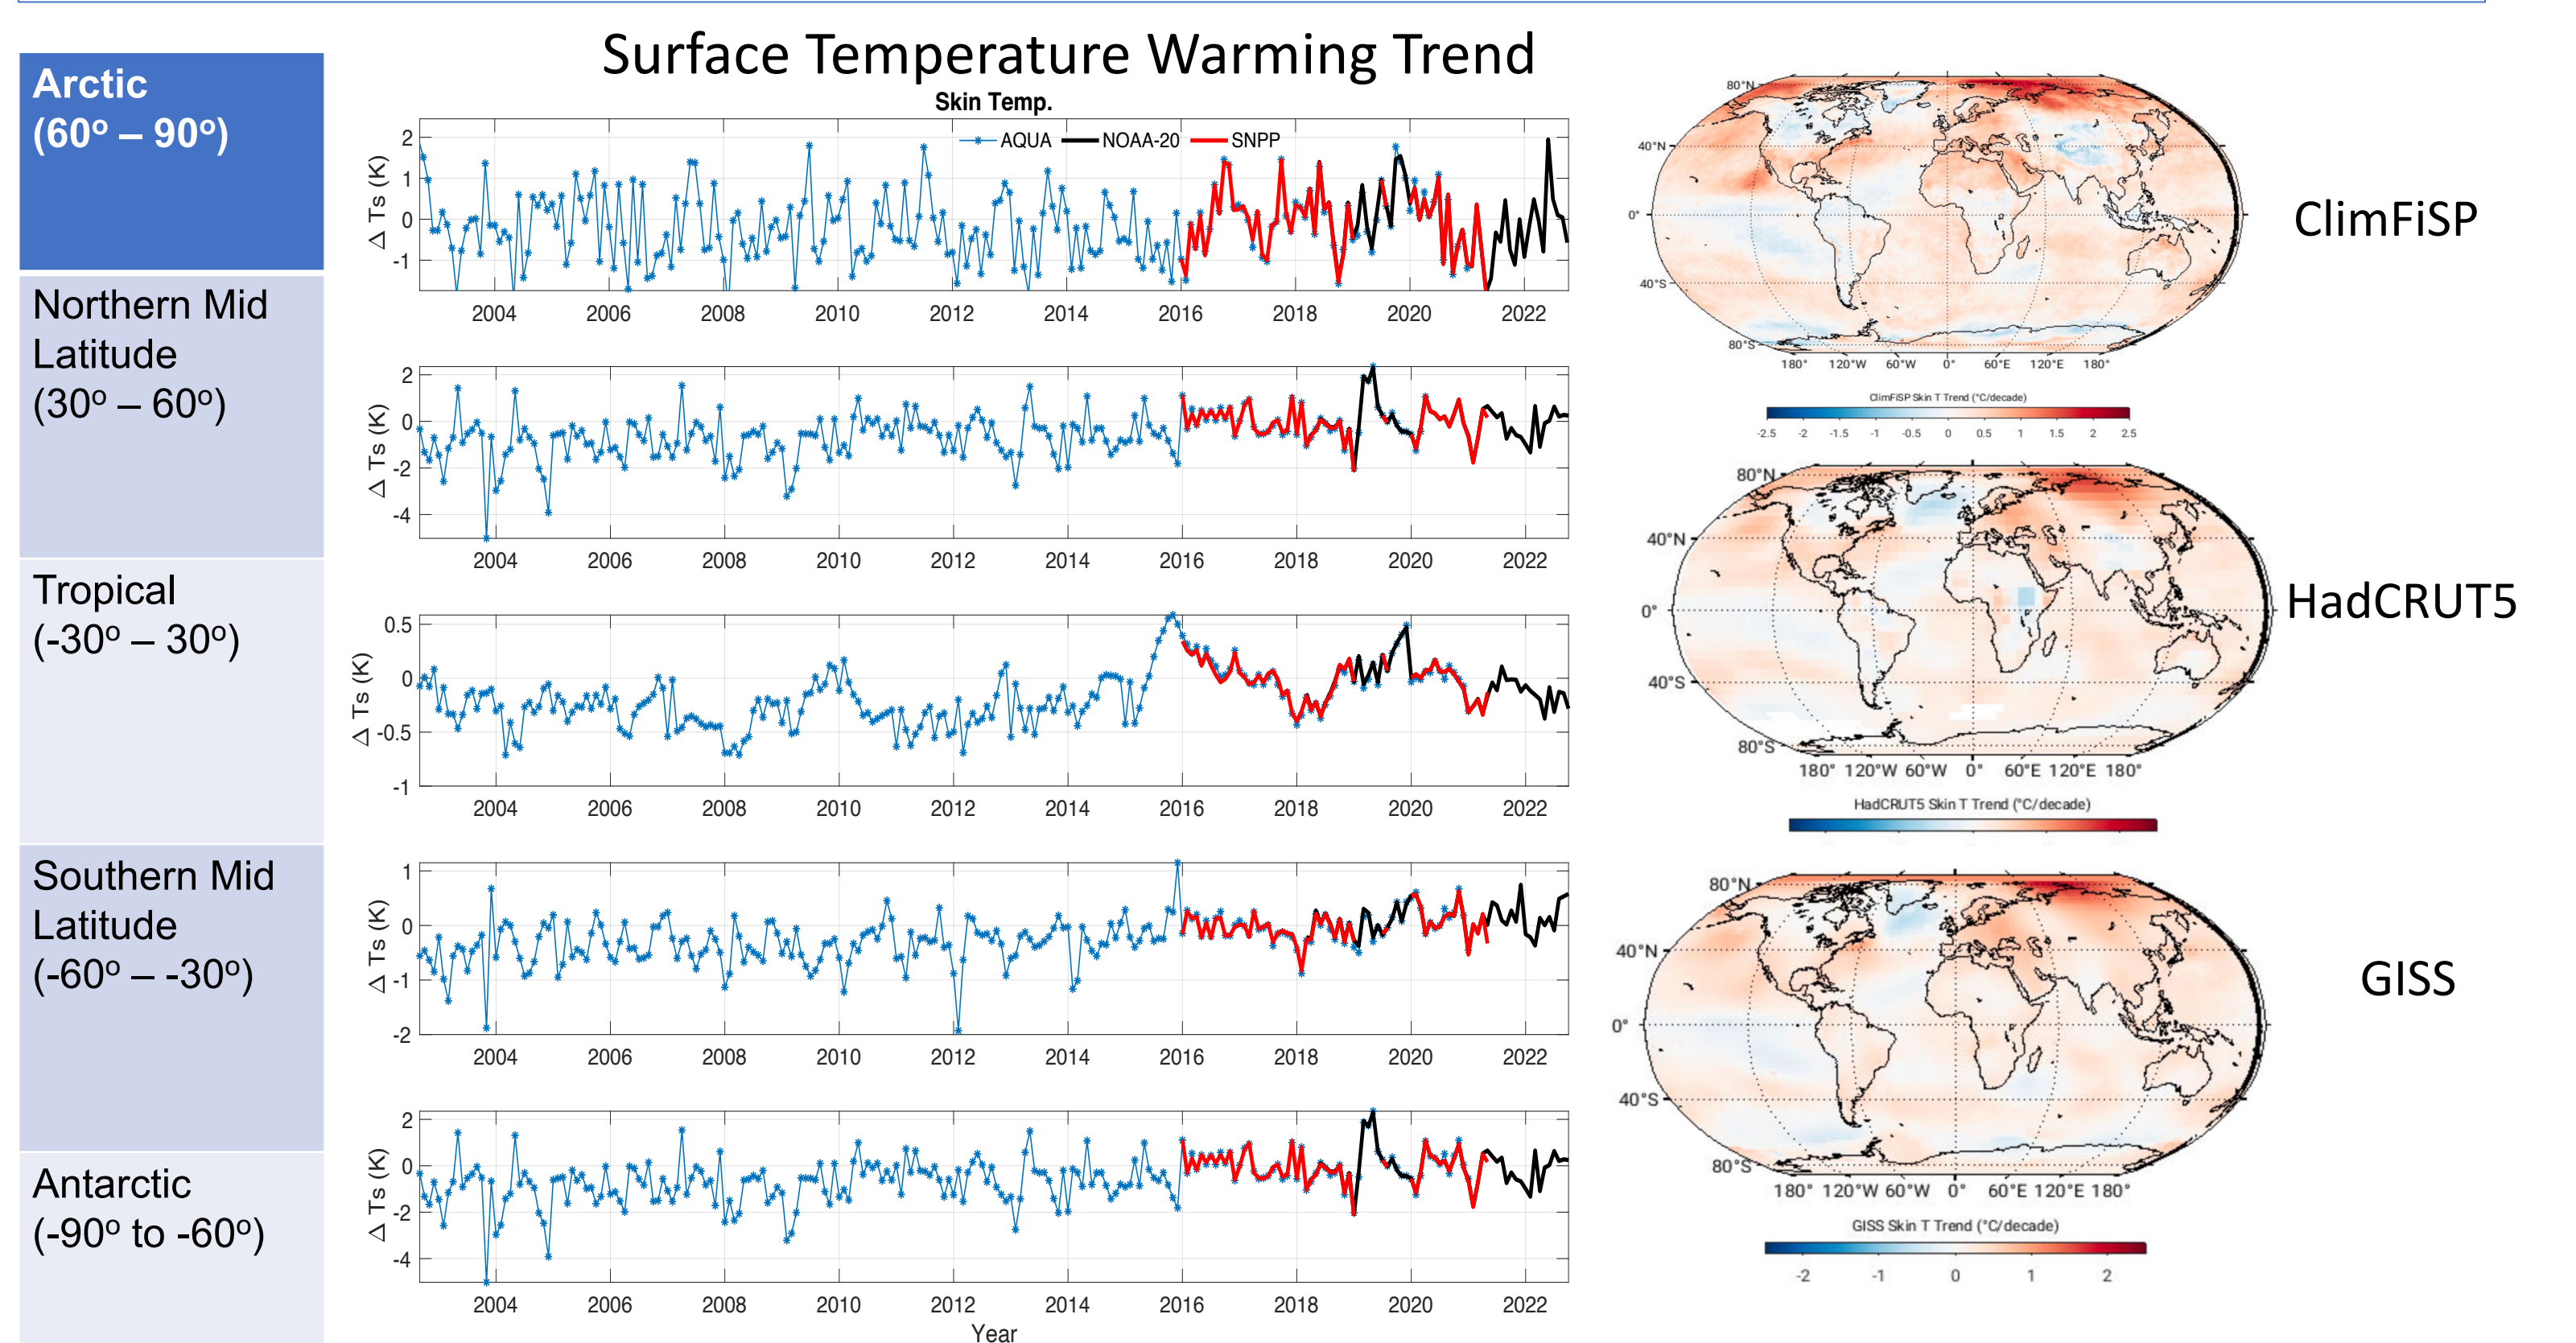

- Modern hyperspectral satellite remote sensors provide wealth of information on atmospheric and surface properties
- Two retrieval algorithms have been developed at NASA Langley
 - **Single Field-of-view Sounder Atmospheric Product (SiFSAP)**: a Level 2 (L2) algorithm and product that can be used for weather, dynamics, and climate studies
 - **Climate Fingerprinting Sounder Products (ClimFiSP)**: a Level-3 (L3) algorithm and product which can generate high-accuracy climate trends, anomalies etc
- Both products will be available at NASA data center for public access

SiFSAP Algorithm and Examples of SiFSAP Products

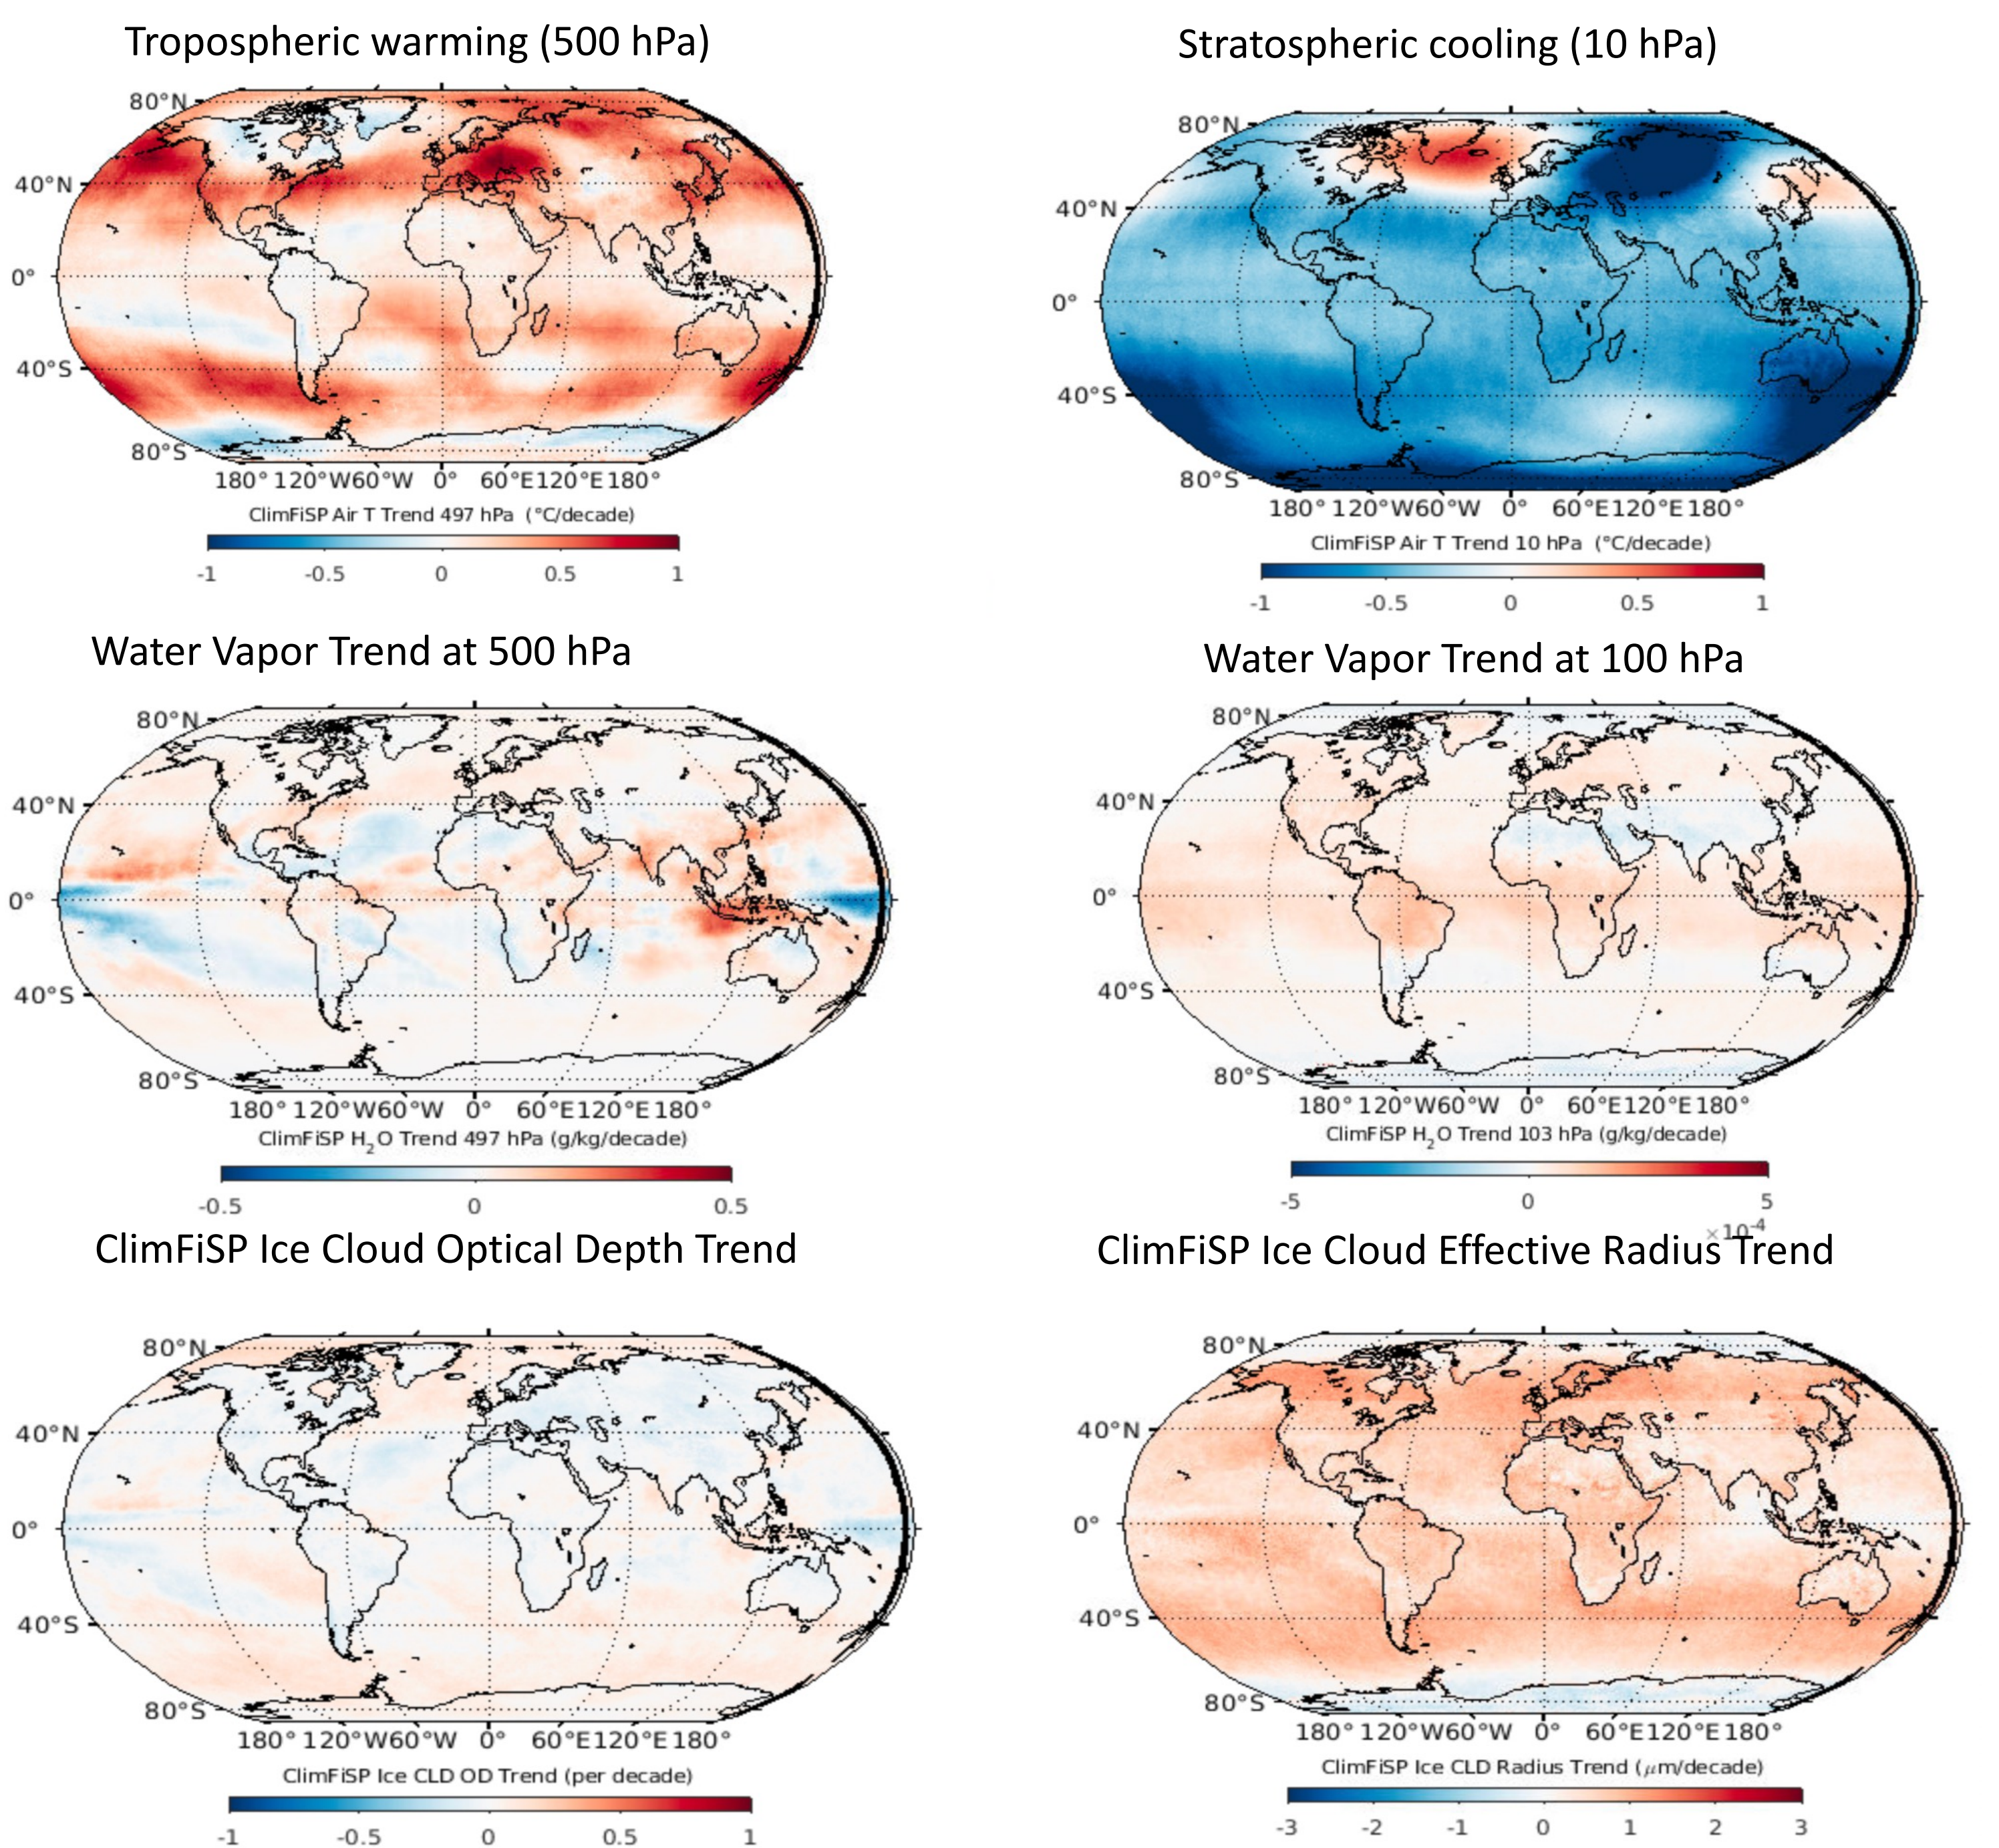

- Key Components:
 - Performs retrieval for each FOV with the presence of clouds
 - High-quality product by ensuring radiometric closure
 - non-linear optimal estimation physical retrieval algorithm
 - 9 times high spatial resolution than current operational CrIS and AIRS products
 - Uses all spectral information instead of selecting only a few hundred channels
 - Fitting observed radiance spectra directly instead of cloud-cleared radiances
- SiFSAP Products:
 - Vertical Profiles of T, H₂O, and trace gases (CO₂, O₃, CO, CH₄, N₂O)
 - Cloud (phase, height, cloud top pressure, particle size, optical depth)
 - Surface temperature and emissivity
 - Averaging kernels and radiative kernels

ClimFiSP Algorithm and Examples of ClimFiSP Products

- Issues with traditional L1-L2-L3 climate products
 - L2 algorithm inconsistency for different satellite sensors
 - Lack of radiance closure (e.g cloud-clearing method)
 - L1-L2-L3 algorithm is computational demanding
- ClimFiSP is designed to address the above-mentioned deficiencies
 - Works on gridded L1 products directly using consistent radiative kernels
 - All parameters including clouds retrieved simultaneously
 - More than 5 orders of magnitude faster than traditional L1-L2-L3 method
 - Quick re-generation of climate products when instrument is re-calibrated or L1 algorithm is improved
- ClimFiSP
 - 21 years of consistent climate products from AIRS, SNPP CrIS, and JPSS CrIS
 - Harvest decades of hyperspectral sounder measurements for climate studies
 - Provides products attractive to wide range of users

O3 total column amount retrieved from satellite-based observations on September 20th, 2019 (A – SNPP/CrIS SiFSAP; B – SNPP/CrIS CLIMCAPS; C – SNPP-OMPS; D – Metop-B/IASI FORLI).

Summary and More information on PCRTM

- Two advance retrieval algorithms SiFSAP and ClimFiSP have been developed at NASA Langley
 - SiFSAP has generated excellent results from AIRS, CrIS, IASI with higher spatial resolution than current NASA and NOAA operational products
 - ClimFiSP has generated 20 years of high-quality climate data records with consistent fingerprinting method from multiple IR sounders
- More than 200 atmospheric and surface parameters retrieved from hyperspectral IR sounders
 - High-quality products due to high information content of hyperspectral IR remote sensors and the advanced algorithms
 - No external information needed
- Consistent retrieval method used for different satellite IR sounders
 - Minimize errors due to forward model or inversion algorithm differences
- Provide radiative kernel and a complete atmospheric state and surface properties for climate model validations
 - Radiative kernel can be used to convert GCM output to TOA satellite radiances
 - Complete atmospheric and surface parameters can be used to calculate OLR, fluxes, heating/cooling rate, and laps rate etc.
