Prospects of model weighting

Prospects of model weighting

Model weighting didn't change things a lot

Prospects of model weighting

Model weighting didn't change things a lot

CMIP6: evaluation of mostly *climatological* biases

No relationship between model bias and future projections

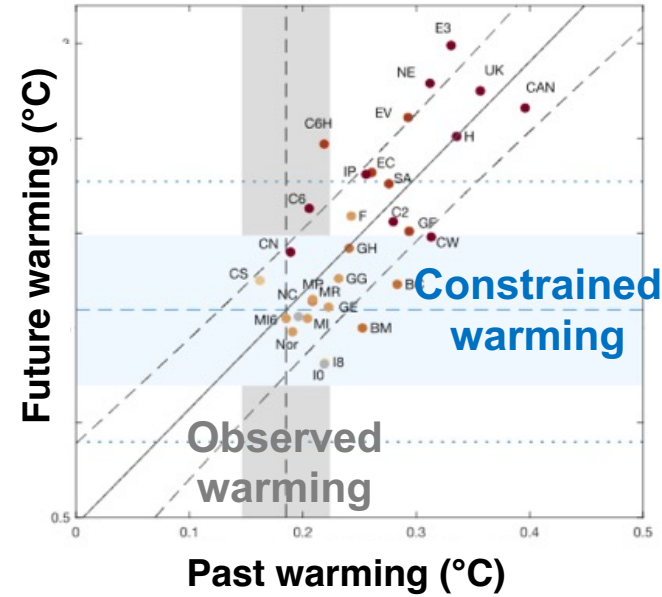

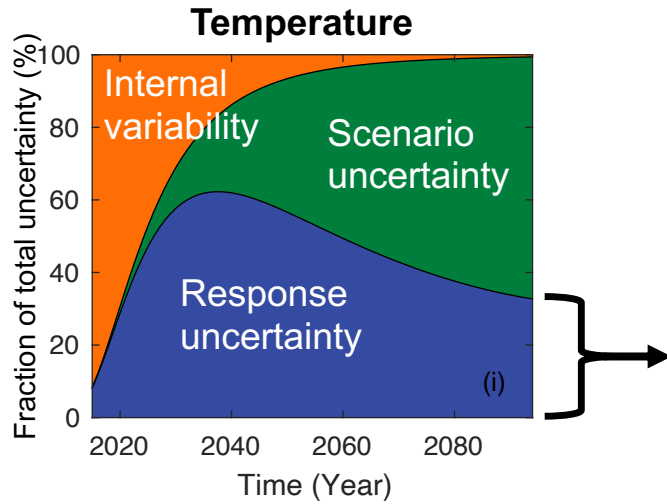

Prospects of model weighting

Prospects of model weighting: temperature

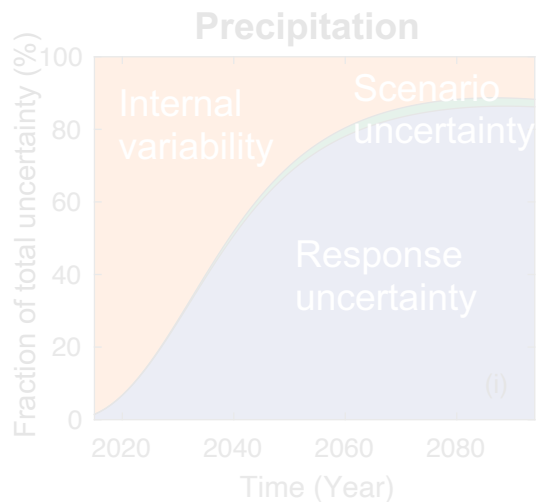

Prospects of model weighting: temperature

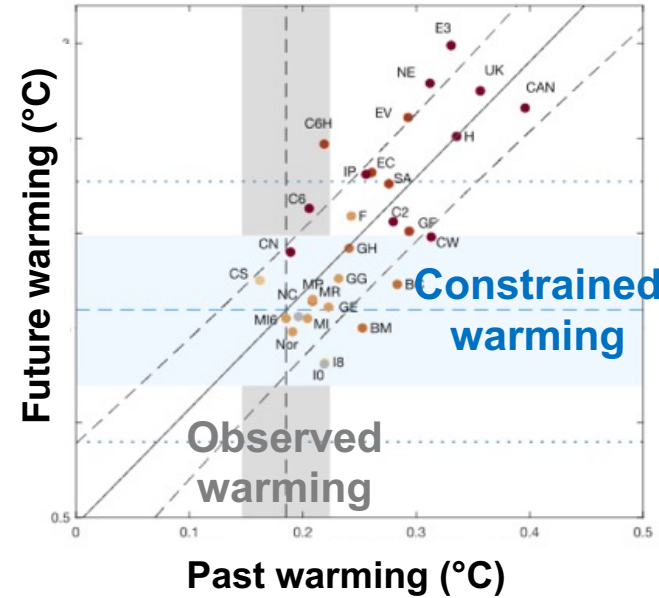

Tokarska et al. (2020, *Science Advances*)

***Models that warm too much today
also warm more (too much?)
in the future***

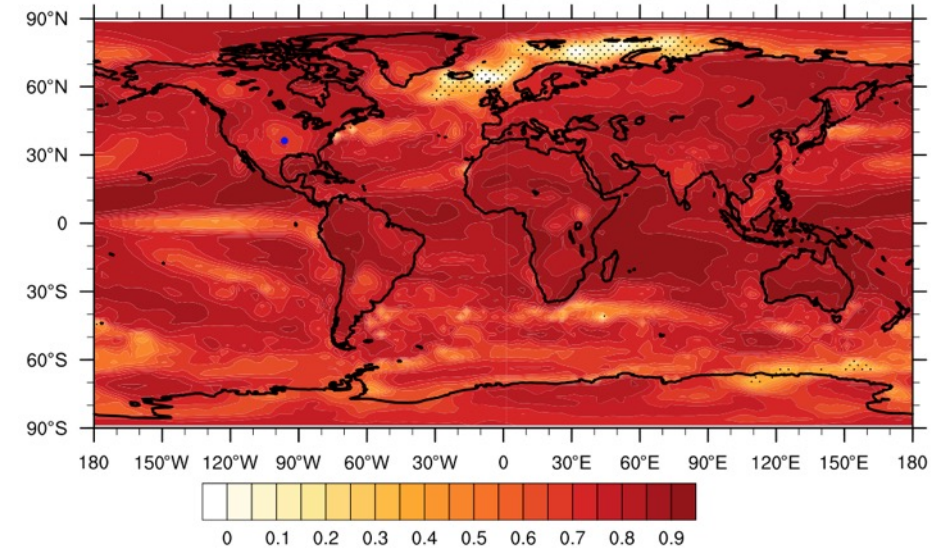

Prospects of model weighting: temperature

Tokarska et al. (2020, *Science Advances*)

Correlation between global and local temperature

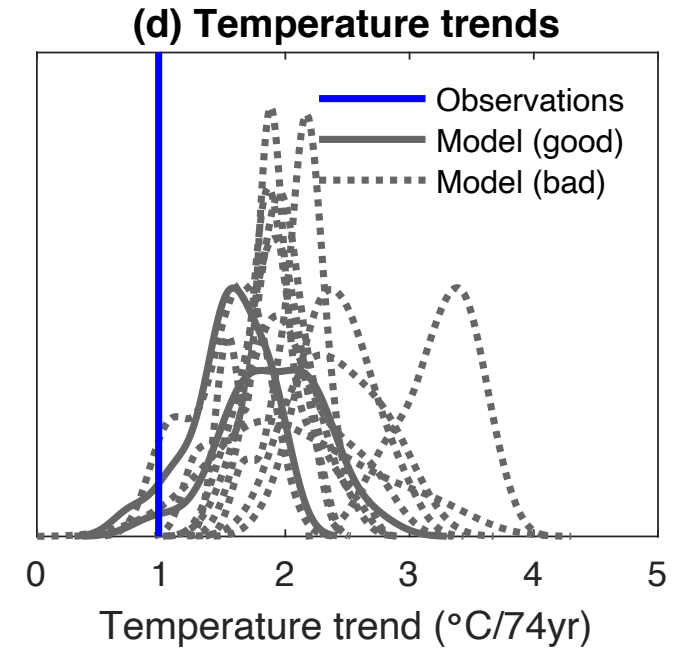

Qasmi & Ribes (2022, *Science Advances*)

**Models that warm too much today
also warm more (too much?)
in the future**

That's also true locally

Prospects of model weighting: temperature

***Models that warm too much today
also warm more (too much?)
in the future***

That's also true locally

Prospects of model weighting: temperature

Socio-economic constraints

after Moore et al. (2022, *Nature*)

Highest and lowest emissions scenarios are less likely

Prospects of model weighting: temperature

Combined constraint

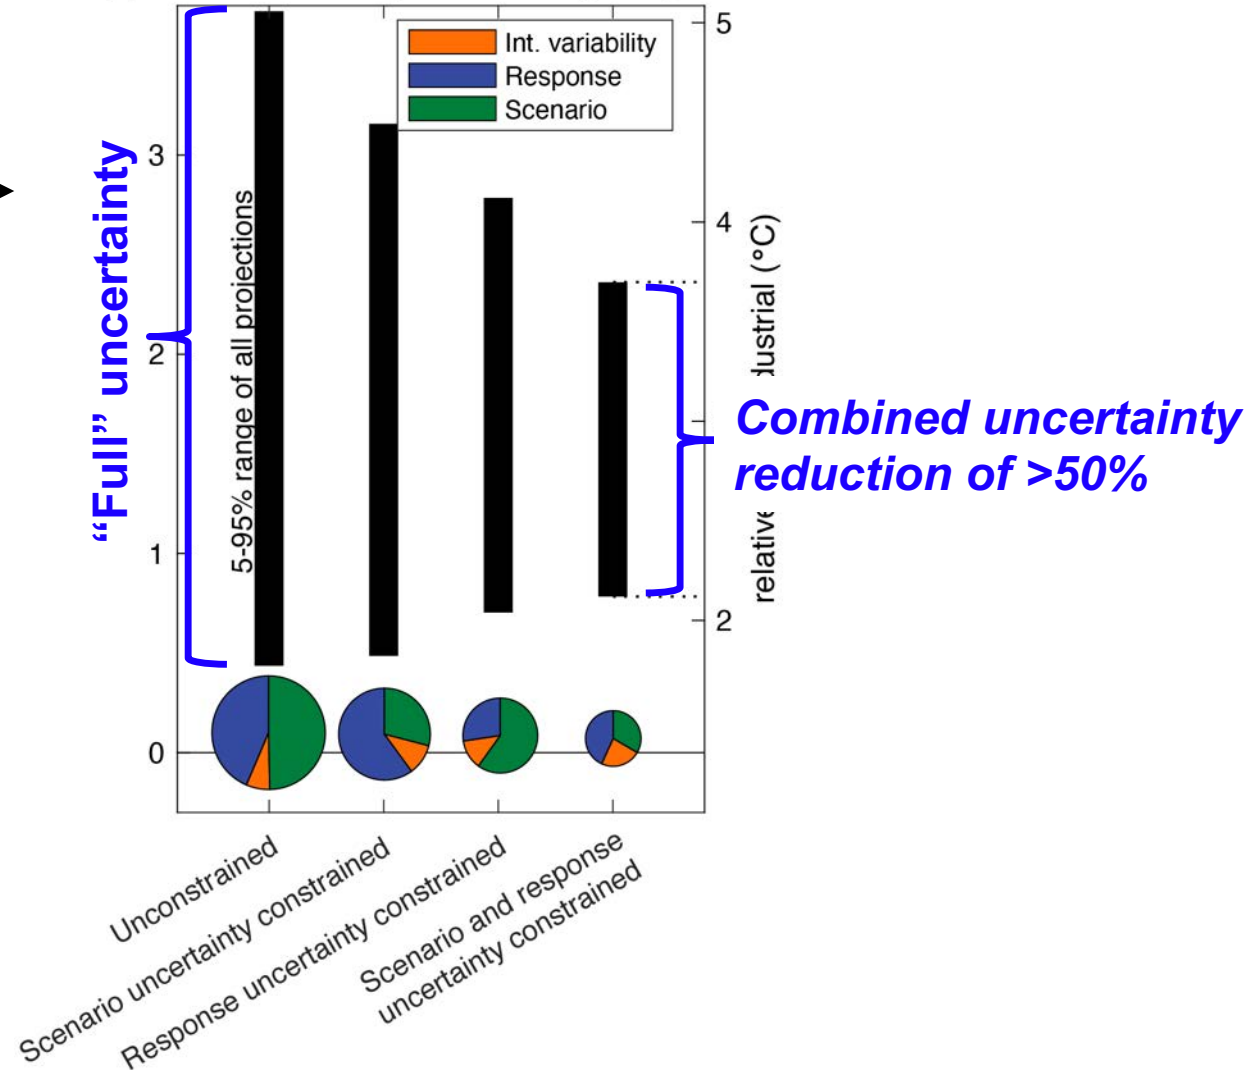

Upper Colorado temperature range at year 2050

Prospects of model weighting: temperature

Combined constraint
Upper Colorado temperature range at year 2050

Prospects of model weighting

Prospects of model weighting: precipitation

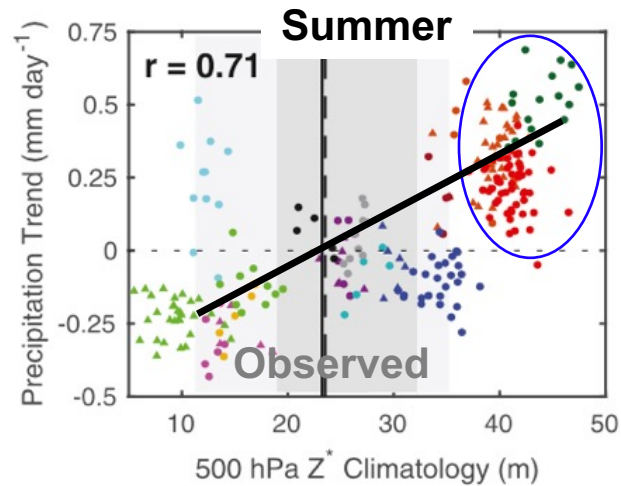

***Observed precipitation trend
within model spread***

Prospects of model weighting: precipitation

Physical constraints (dynamics)

Models with the most extreme winter drying and summer wetting are less realistic

Prospects of model weighting: precipitation

Anthropogenic Aerosols Contribute to the Recent Decline in Precipitation Over the U.S. Southwest

↑ post-1980

Yan-Ning Kuo¹ , Hanjun Kim¹ , and Flavio Lehner^{1,2,3}

Observations

(b) SST LFP2

(j) Regression on LFC2

Prospects of model weighting: precipitation

Anthropogenic Aerosols Contribute to the Recent Decline in Precipitation Over the U.S. Southwest

post-1980

Yan-Ning Kuo¹ , Hanjun Kim¹ , and Flavio Lehner^{1,2,3}

Observations

(b) SST LFP2

CESM2-LE

(d) SST LFP2

(j) Regression on LFC2

(l) Regression on LFC2

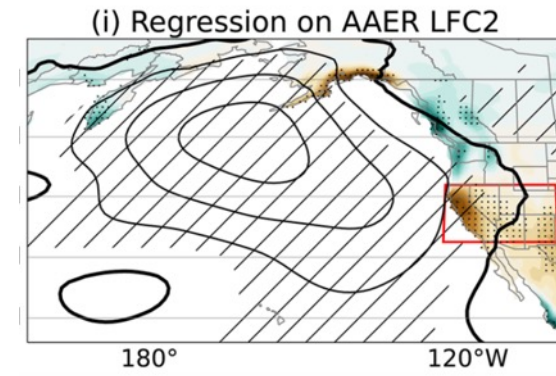

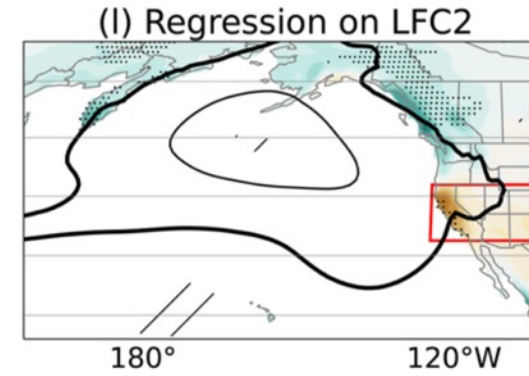

Prospects of model weighting: precipitation

Anthropogenic Aerosols Contribute to the Recent Decline in Precipitation Over the U.S. Southwest

post-1980

Yan-Ning Kuo¹, Hanjun Kim¹, and Flavio Lehner^{1,2,3}

Prospects of model weighting: precipitation

Sensitivity of LFC2-caused PRECT Trend to LFC2 Trend

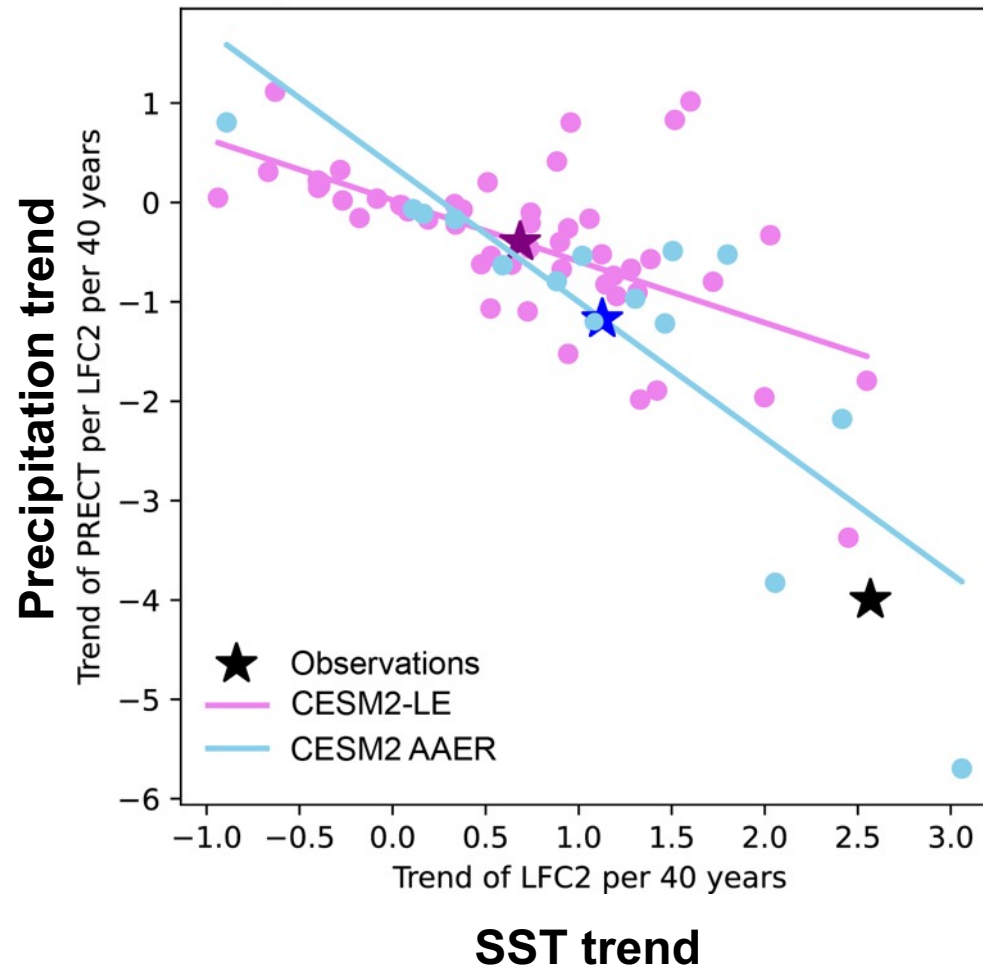

Models might underestimate the strength of the aerosol-SST-precipitation link

Prospects of model weighting: precipitation

Sensitivity of LFC2-caused PRECT Trend to LFC2 Trend

Models might underestimate the strength of the aerosol-SST-precipitation link

Attributing Compound Events to Anthropogenic Climate Change

Jakob Zscheischler and Flavio Lehner

Several proposed tests to determine “fit for purpose” of models

Attributing Compound Events to Anthropogenic Climate Change

Jakob Zscheischler and Flavio Lehner

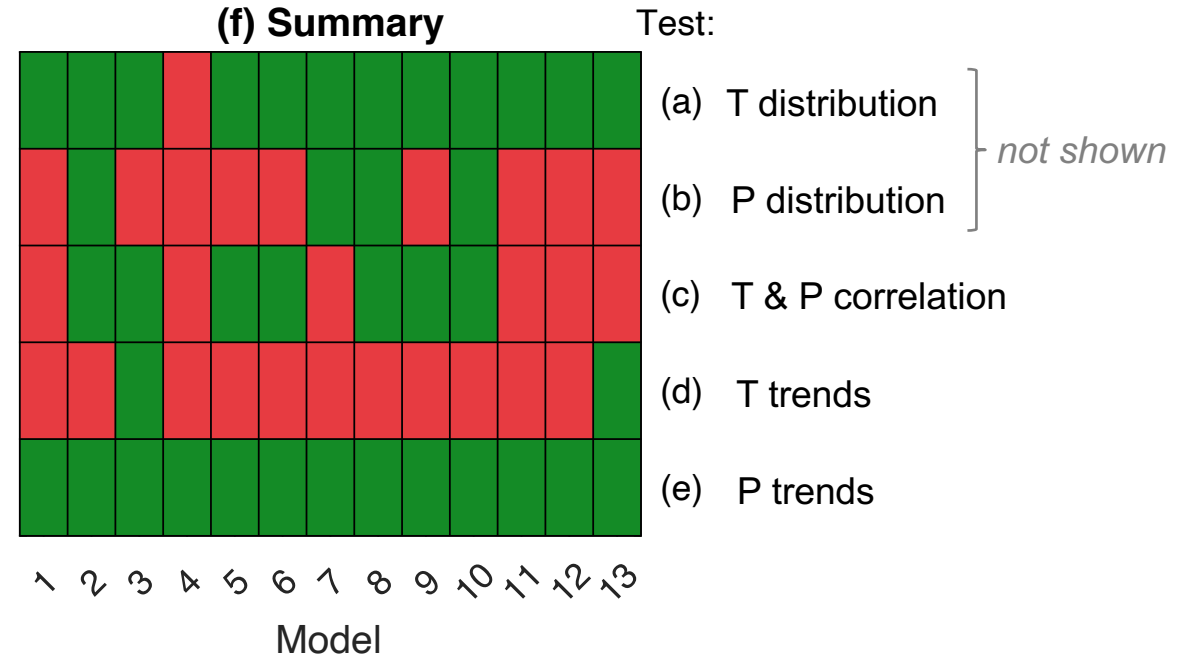

(c) Correlation of detrended temperature and precipitation

Models tend to have a weak correlation between temperature and precipitation

Attributing Compound Events to Anthropogenic Climate Change

Jakob Zscheischler and Flavio Lehner

No model passes all tests → model weighting

Prospects of model weighting

Can we constrain streamflow and reservoir storage projections?

Prospects of model weighting

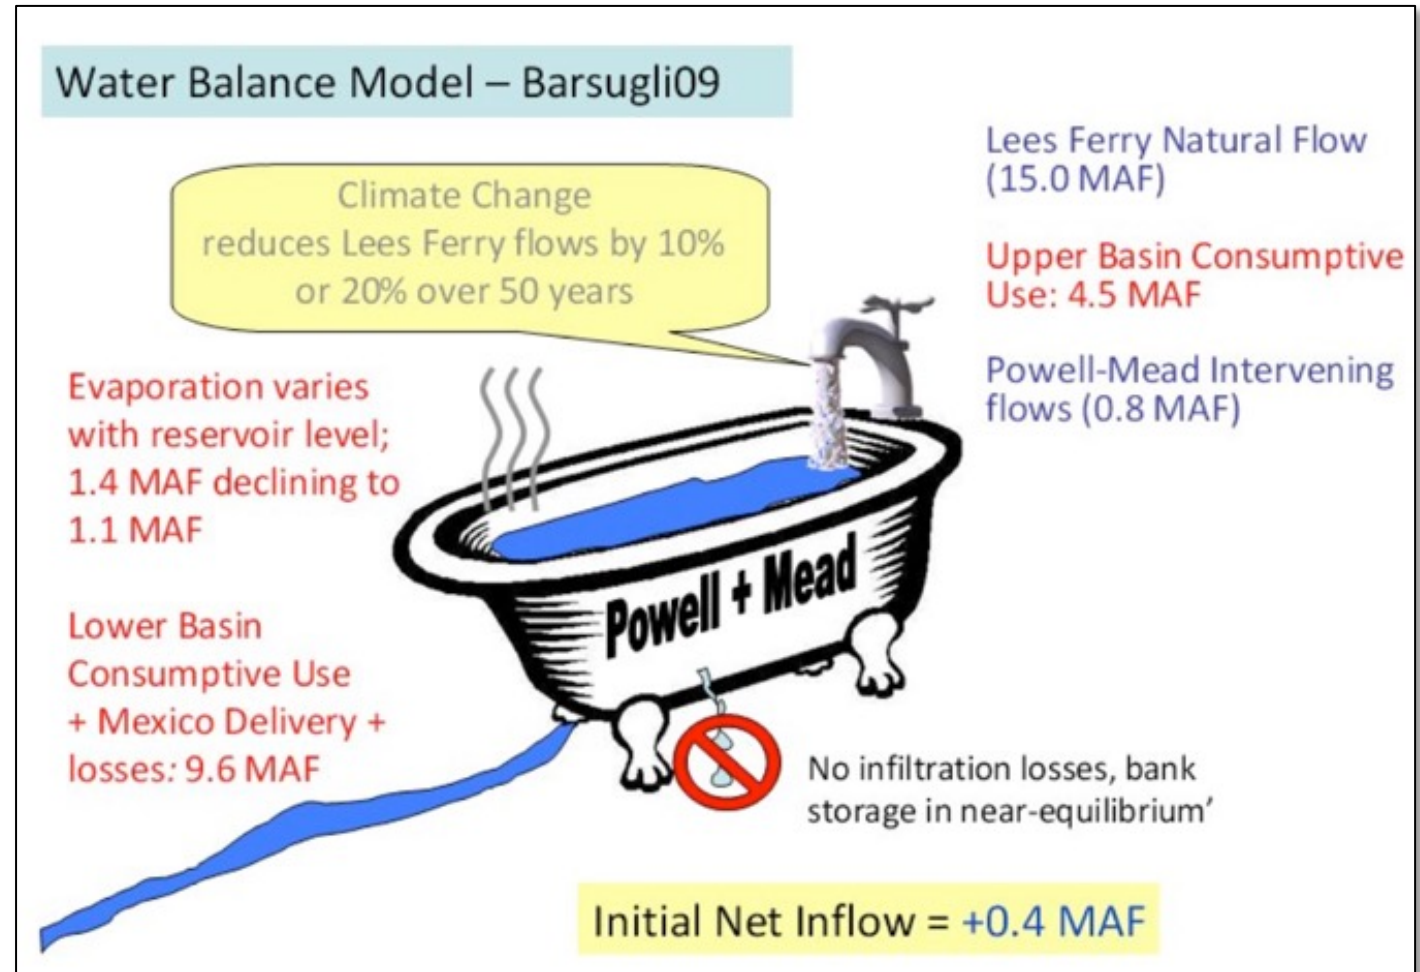

Can we constrain streamflow and reservoir storage projections?

Preliminary!

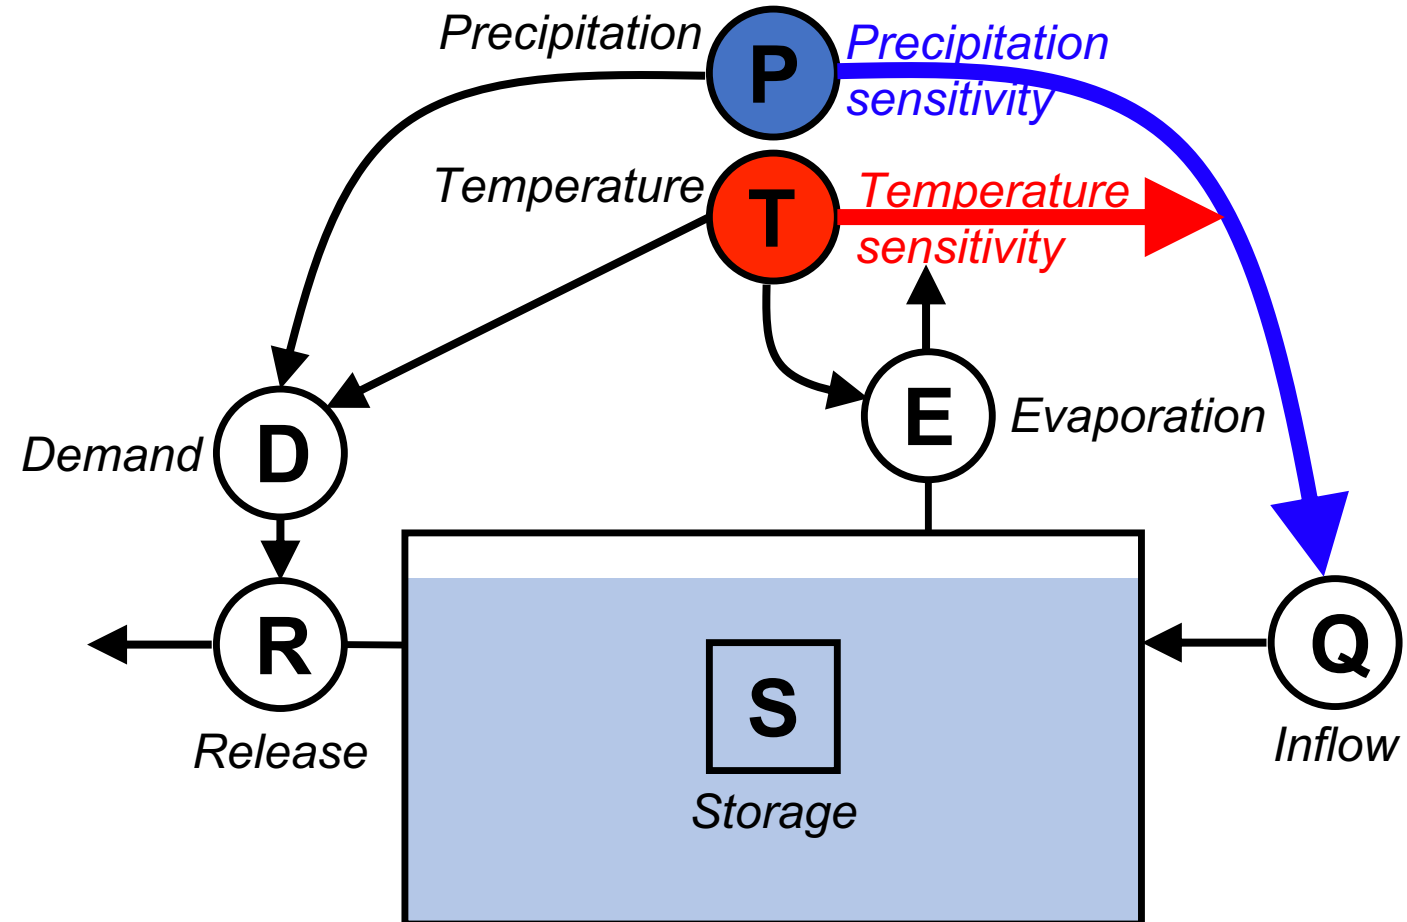

Weighting scheme following Sanderson et al. (2015, *J. Clim.*)
Knutti et al. (2017, *Geophys. Res. Lett.*)

Simple reservoir model application

Barsugli and Lukas (2010, *Western Water Assessment*)

Reservoir model

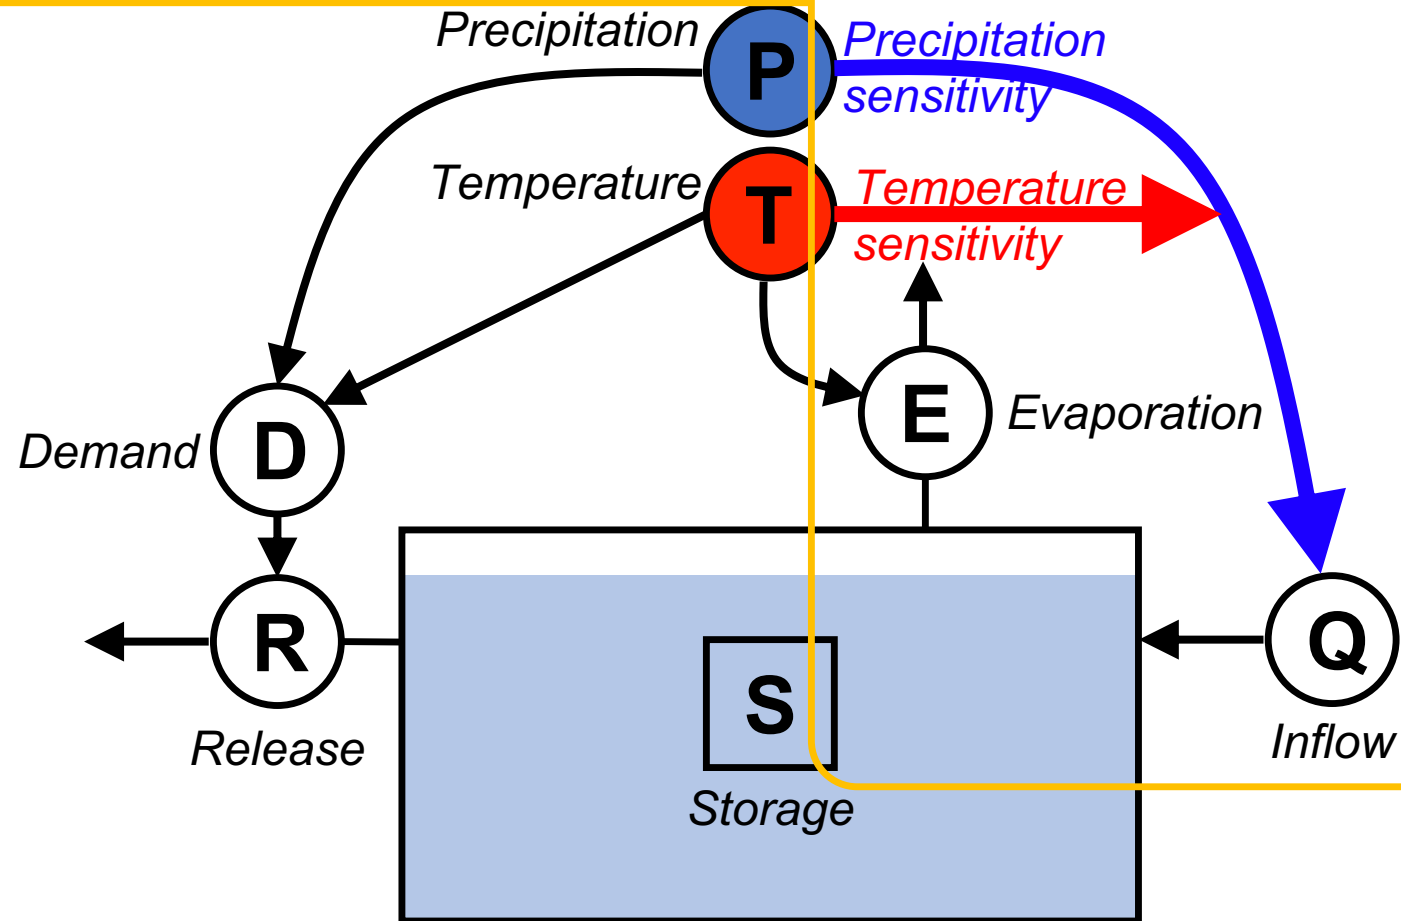

Simple reservoir model application

Reservoir model

Validation of recent runoff trends in Earth System Models (poster)
Hanjun Kim

Projections

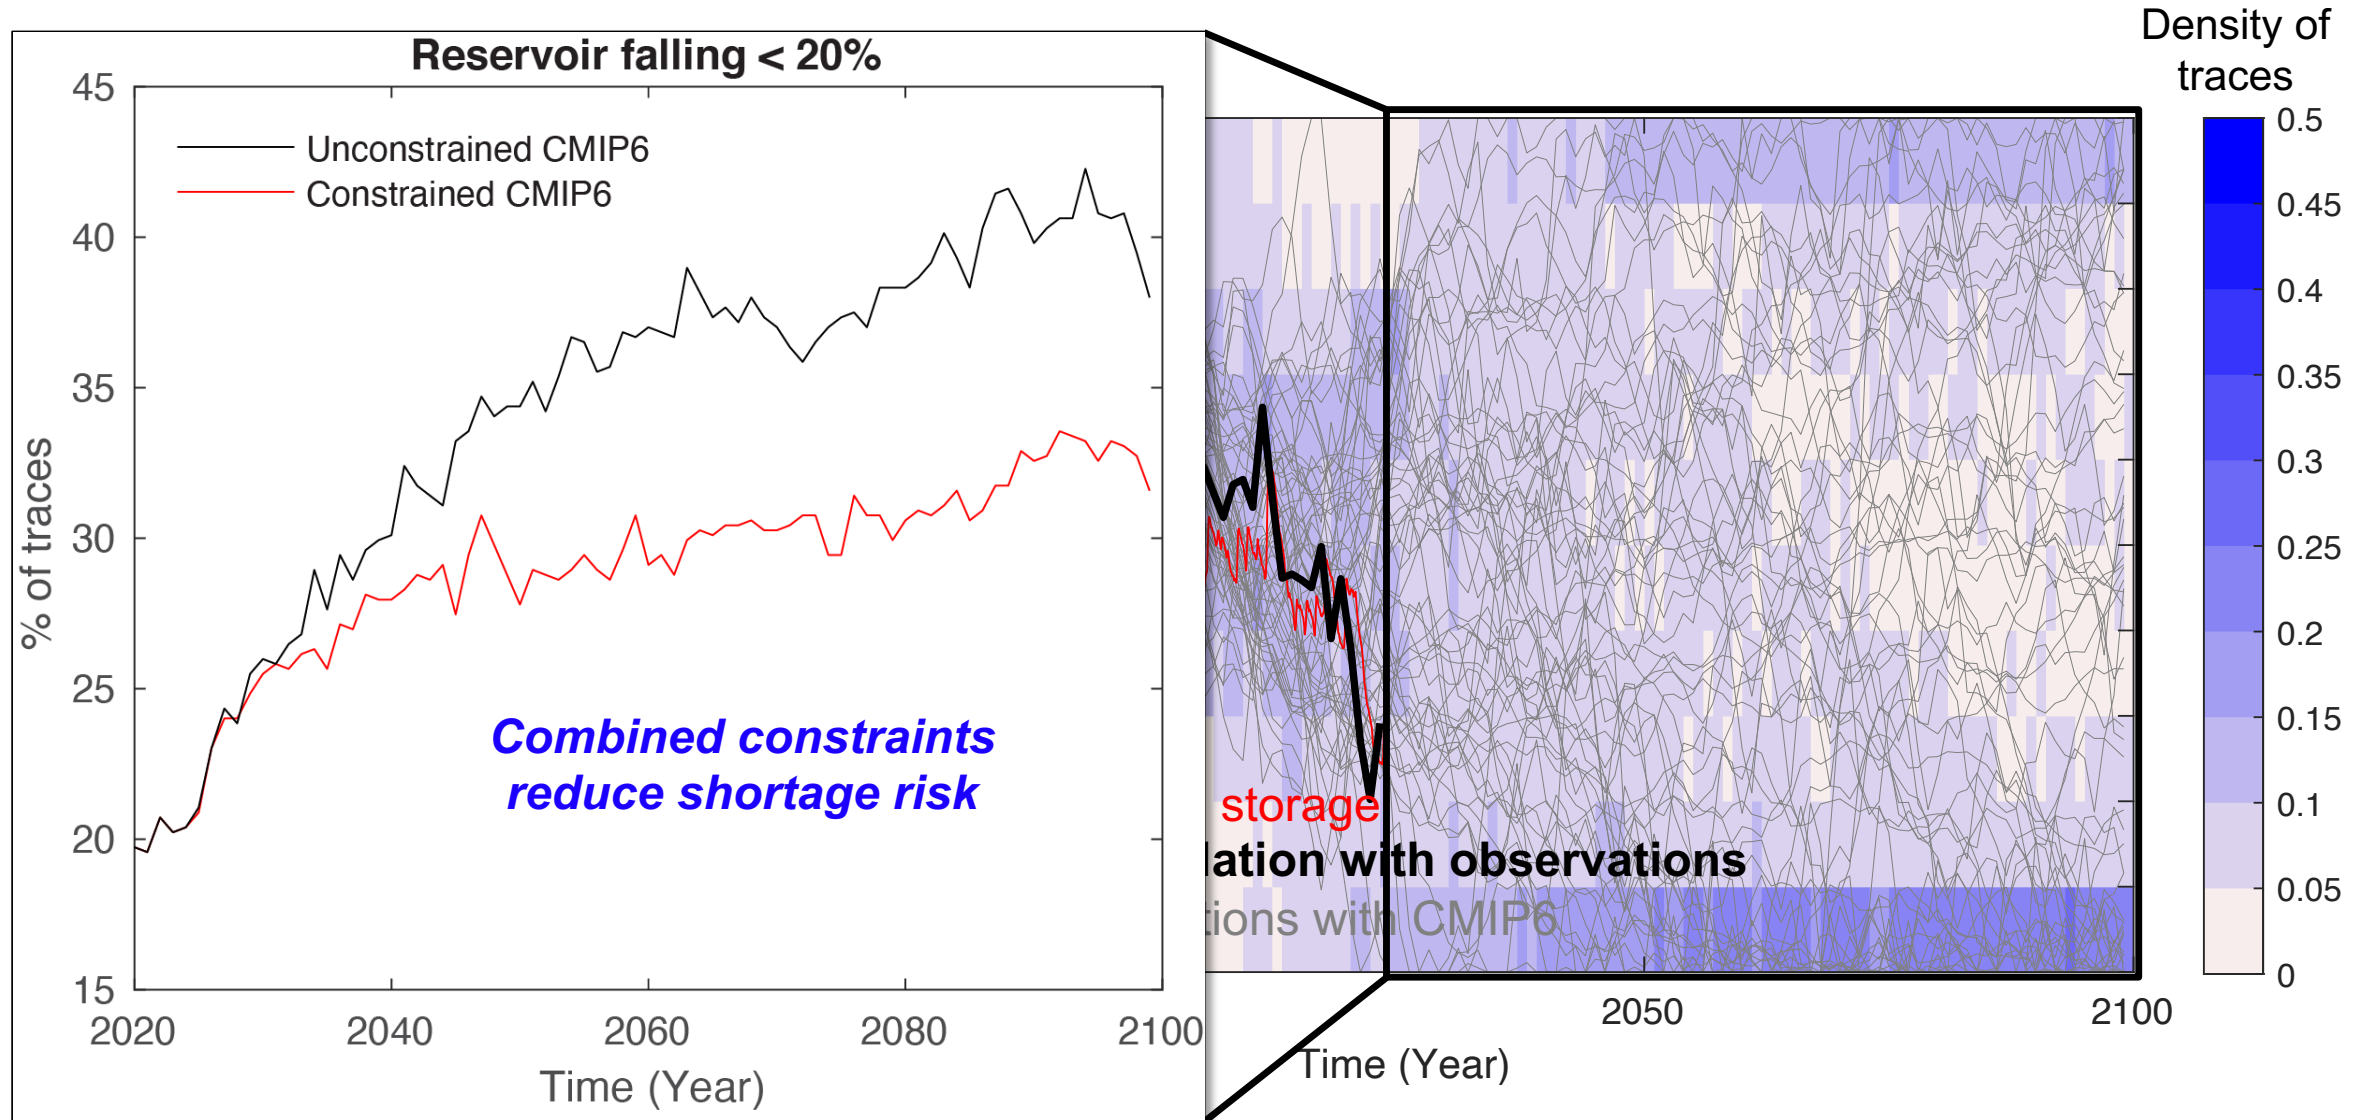

- >600 simulations
- 5 emissions scenarios
- 1 base demand scenario
- 1 set of runoff sensitivities

Projections

Projections

- **Progress on constraints of regional climate change with help of large ensembles**
- **Exploring constraints in practical applications**
- **Caveats remain regarding model bias understanding**
 - Global temperature trends
 - SST-affected teleconnections
 - Land-atmosphere coupling
 - ...

Climate Variability, Change, and Impacts

Projections

Projections

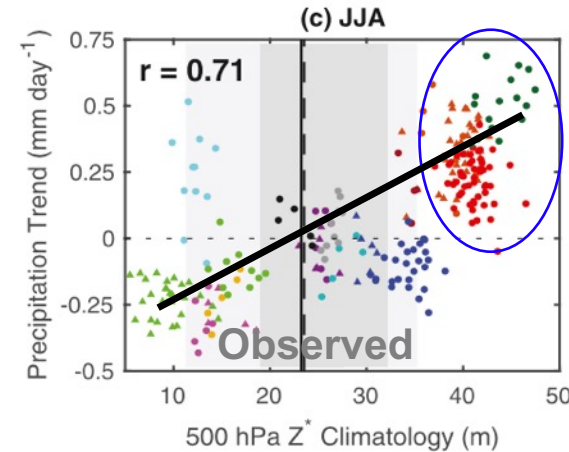

Prospects of model weighting

Physical constraints (dynamics)

Present-day representation in mid-tropospheric ridging explains precipitation spread

Models with the most extreme winter drying and summer wetting are less realistic

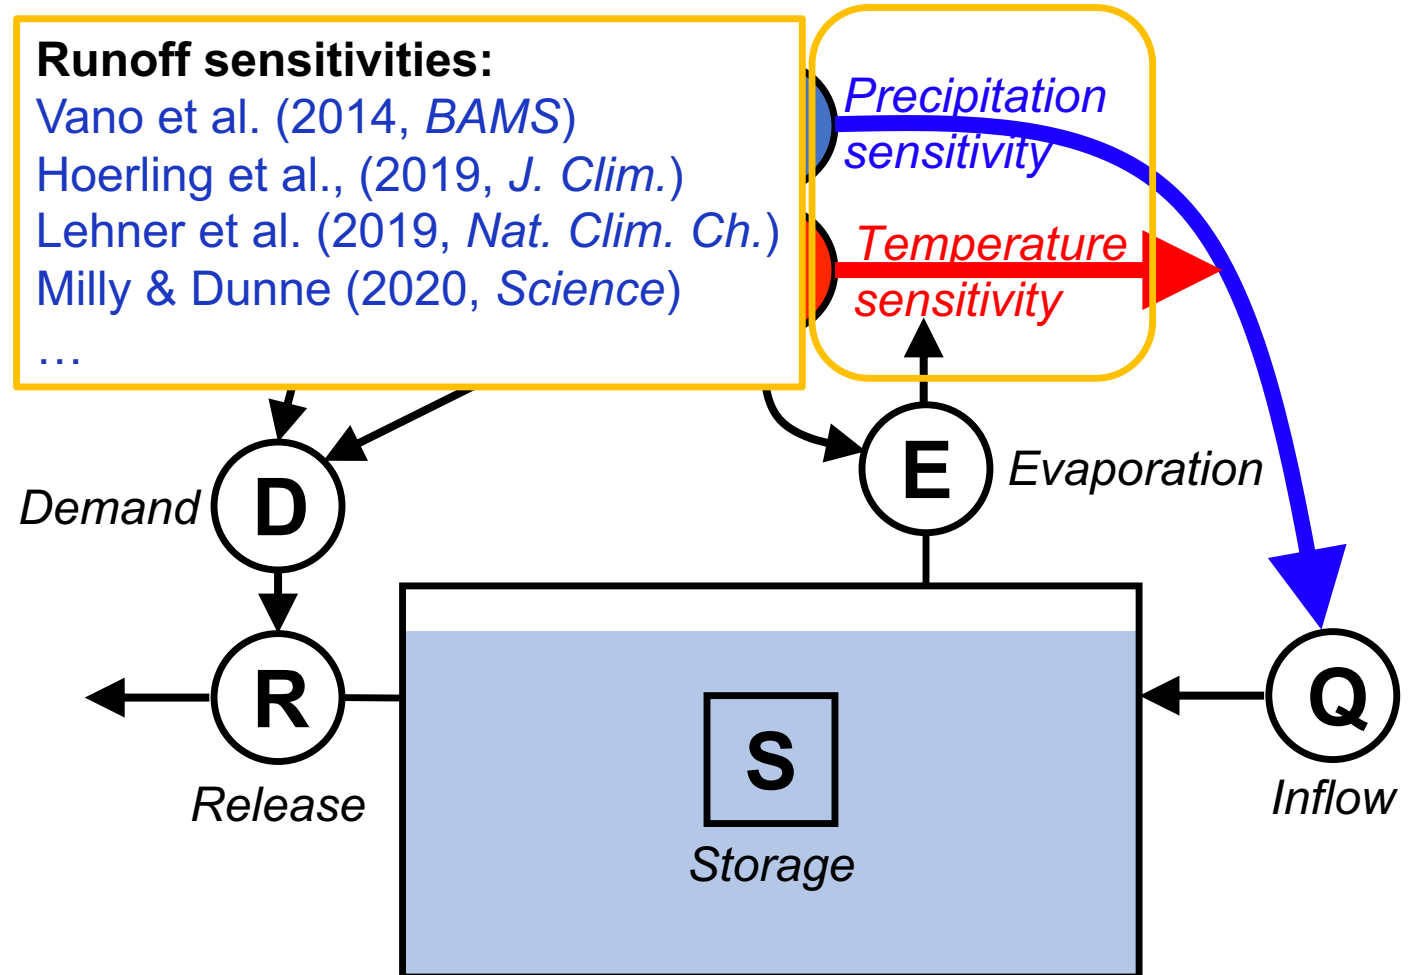

Validation of recent runoff trends in Earth System Models (poster)
Hanjun Kim

Reservoir model

Runoff sensitivities:

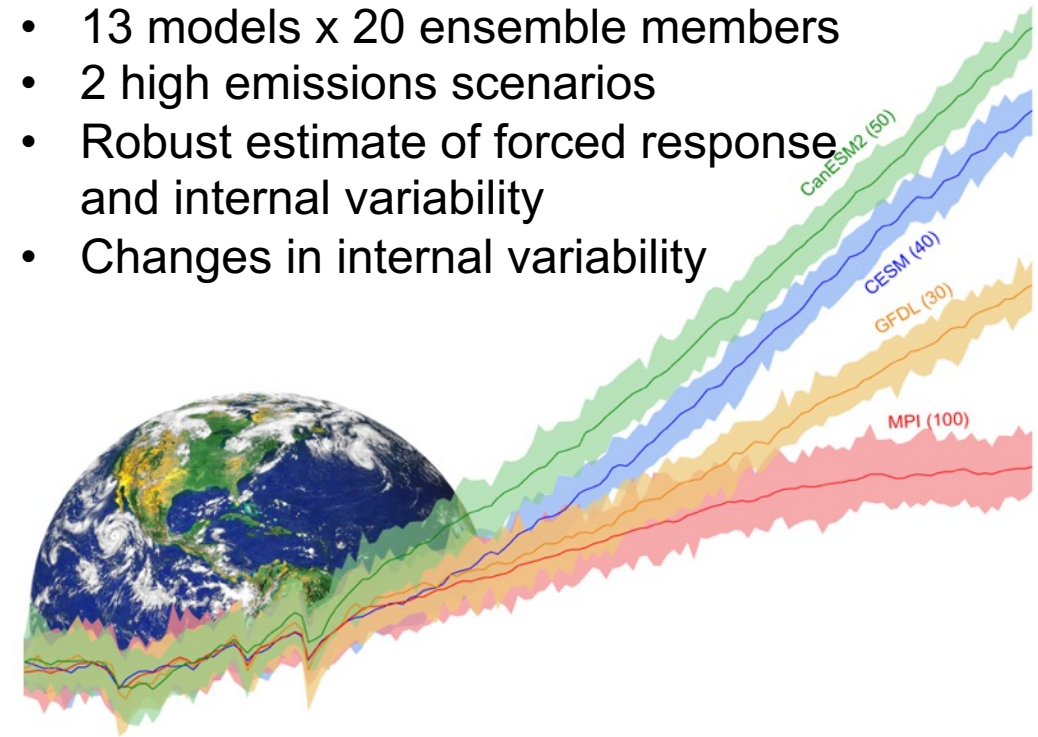

Vano et al. (2014, *BAMS*)
Hoerling et al., (2019, *J. Clim.*)
Lehner et al. (2019, *Nat. Clim. Ch.*)
Milly & Dunne (2020, *Science*)
...

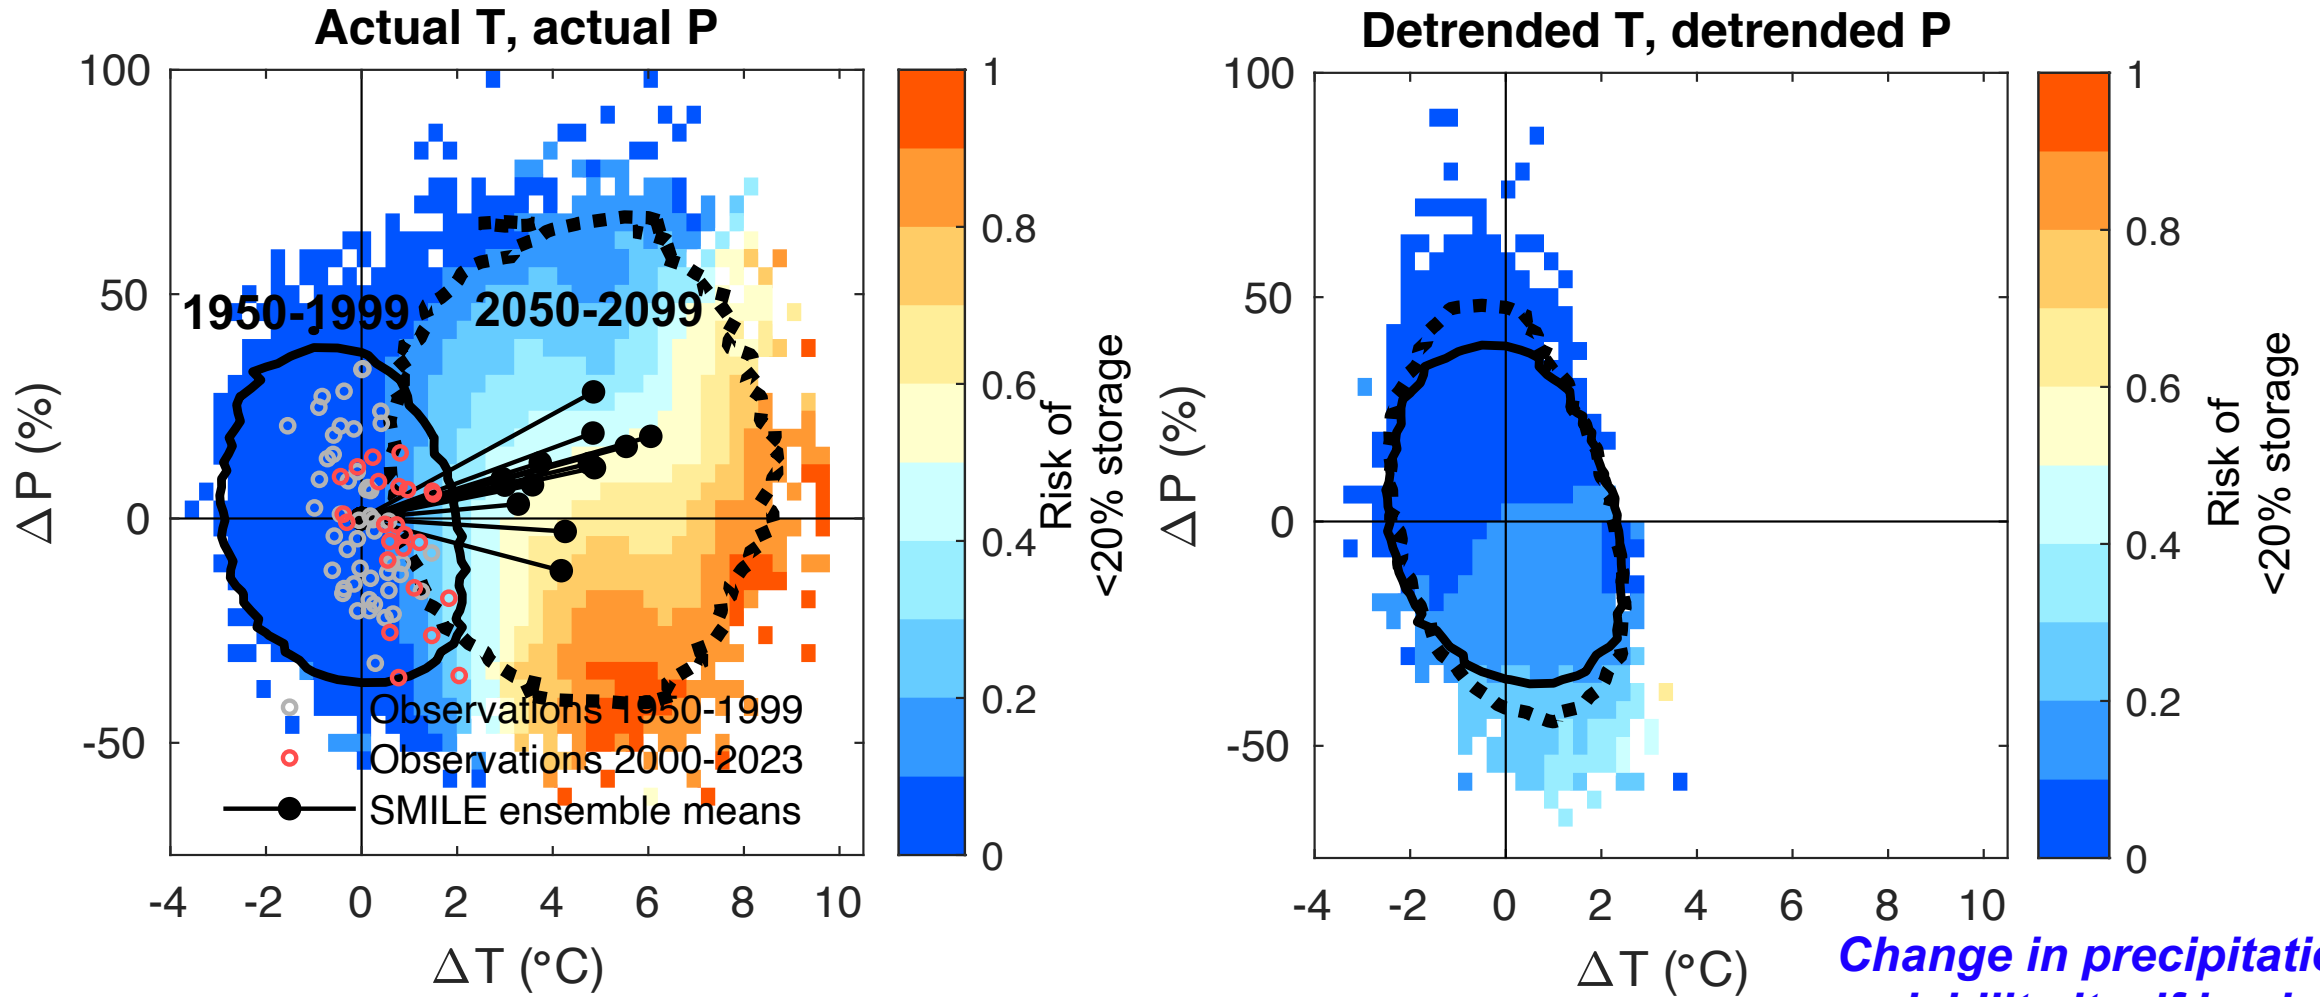

Projections with Single Model Initial-Condition Large Ensembles

- 13 models x 20 ensemble members
- 2 high emissions scenarios
- Robust estimate of forced response and internal variability
- Changes in internal variability

Projections with Single Model Initial-Condition Large Ensembles

Change in precipitation variability itself leads to changes in risk
